
Configuration of USB7202/USB7206/USB725x

<i>Author: Andrew Rogers Microchip Technology Inc.</i>
--

1.0 INTRODUCTION

The USB7202/USB7206/USB7250/USB7251/USB7252/USB7256 can be configured through:

- Hardware configuration straps (See USB7202/USB7206/USB7250/USB7251/USB7252/USB7256 Data Sheet for hardware strap descriptions.)
- SMBus during start-up configuration stage (SOC_CFG)
- SMBus during hub operational stages (during runtime)
- One-Time Programmable (OTP) memory
- A USB interface during hub operational stages (during runtime)
- An external Serial Peripheral Interface (SPI) Flash

SMBus Configuration: The hub may be configured via the SMBus slave interface during the hub's start-up configuration stage (or SOC_CFG). To hold the hub in the SOC_CFG stage, the CONFIG_STRAP pins must be set with the correct configuration mode (CONFIG1 for USB7202/USB7206/USB7251/USB7252/USB7256, and CONFIG1, 2, 3, or 5 for USB7250) and the SMBus slave clock and data pins must be sampled as 'high' (10k pull-up resistors to 3.3V recommended) at power-on or when RESET_N is deasserted. Once in the configuration stage, any of the registers may be reconfigured. The hub waits in SOC_CFG indefinitely until it receives the special Attach command.

After the hub has exited the SOC_CFG stage, the configuration registers may still be manipulated via SMBus. This may be useful for enabling an external SOC to control the hub's GPIOs or to check certain hub status registers.

OTP Memory: The hub's registers may be configured via the hub's internal OTP memory. Any register may be given a new default value. The OTP memory is 8 kB, and each bit within the OTP memory may be set once, but never cleared. The OTP commands are loaded sequentially, so it is possible to overwrite a previously programmed register setting by programming that register subsequently with a new value. The OTP memory may be programmed via the USB interface or via SMBus.

USB Interface: All registers are accessible from the USB host using vendor-specific commands issued to the hub's internal Hub Feature Controller device.

External SPI Memory Device: If a custom firmware image is being used and executed from an attached SPI memory device, the configuration registers may also be configured within the SPI image. This method mimics the OTP configuration method and is referred to as "pseudo-OTP."

1.1 Sections

This document includes the following topics:

- [Hub Operational Mode on page 3](#)
- [Register Map on page 5](#)
- [SMBus Configuration on page 111](#)
- [OTP Configuration on page 116](#)
- [Hub Product IDs on page 133](#)
- [Physical and Logical Port Mapping on page 134](#)
- [Billboard Device on page 139](#)

2.0 HUB OPERATIONAL MODE

2.1 Hub Configuration Stages

The hub is configured in three stages. The SOC_CFG stage is only entered if the CONFIG_STRAP pins are set with the correct configuration mode (CONFIG1 for USB7202/USB7206/USB7251/US7252/USB7256, and CONFIG1, 2, 3, or 5 for USB7250) and the SMBus slave interface pins (data and clock) are both sampled as 'high' at start-up. During this stage, the hub allows an external SOC to configure the registers. The hub waits in SOC_CFG until it receives the special Attach command.

After SOC_CFG is complete (or if SOC_CFG is bypassed), the hub loads its OTP memory contents and manipulates the registers based on the OTP configuration. [Figure 1](#) explains the hub start-up flow.

FIGURE 1: HUB CONFIGURATION OPERATIONAL MODE FLOWCHART

Note: Because the OTP configuration registers are loaded after the SOC_CFG stage, it is possible for configuration registers modified in the SOC_CFG stage to be overwritten in the CFG_OTP stage. If a register is modified in both the SOC_CFG and OTP_CFG stages (an OTP patch was programmed to the hub OTP), then the register value, as written in the OTP_CFG stage, takes effect.

2.2 SMBus Protocol

The SMBus protocol is a flexible 2-pin serial protocol used for low-speed communication between integrated circuits. The protocol consists of an SMBCLK pin generated by the SMBus master and a bi-directional SMBDATA pin that can be driven by a master or a slave. The bus requires a pull-up resistor on both SMBCLK and SMBDATA to function. The hub configures the pins as Open/Drain buffers, where the driver either tristates the pin or drives the pin to GND. The input threshold for the high level ranges from 1.2V to 3.3V, allowing the hub to communicate with a large sample of SOCs on the market. Refer to the *System Management Bus Specification* for more details on the timing specifications of the bus.

3.0 REGISTER MAP

Note: It is recommended not to modify the current values of Reserved bits to avoid operation failure.

3.1 Configuration Registers (Base Address: BF80_0000h)

TABLE 1: CONFIGURATION REGISTERS MEMORY MAP

Configuration Registers			Base Address: BF80_0000h	
Offset	R/W	Name	Function	Modification Stage

TABLE 45: VENDOR ID LSB

VID_LSB OFFSET: 3000h RESET = 24h			USB2.0 Vendor ID LSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	VID_LSB	R/W	Least Significant Byte of the Hub Vendor ID. This is a 16-bit value that uniquely identifies the vendor of the user device (assigned by USB-Implementers Forum). The Microchip Vendor ID is 0424h.

TABLE 46: VENDOR ID MSB

VID_MSB OFFSET: 3001h RESET = 04h			USB2.0 Vendor ID MSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	VID_MSB	R/W	Most Significant Byte of the Hub Vendor ID. This is a 16-bit value that uniquely identifies the vendor of the user device (assigned by USB-Implementers Forum). The Microchip Vendor ID is 0424h.

TABLE 47: PRODUCT ID LSB

PID_LSB OFFSET: 3002h RESET = XXh			USB2.0 Product ID LSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PID_LSB	R/W	Least Significant Byte of the Hub Product ID. This is a 16-bit value that the vendor can assign and uniquely identifies this product. The default value is dependent on the part as shown below: USB7202 = 02h USB7206 = 06h USB7250 = 50h USB7251 = 51h USB7252 = 52h USB7256 = 56h

Note 1: If port disable straps are implemented, these values will automatically decrement by the number of ports disabled by strapping. For example, if a design that implements USB7256 with two ports disabled by strapping, the Product ID (PID) will automatically change to 0x7254.

TABLE 48: PRODUCT ID MSB

PID_MSB OFFSET: 3003h RESET = 42h			USB2.0 Product ID MSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PID_MSB	R/W	Most Significant Byte of the Hub Product ID. This is a 16-bit value that the vendor can assign that uniquely identifies this product. The default value is shown below: All part numbers = 42h

Note 1: The USB2.0 hub Product ID MSB is assigned '42'. The USB3.2 equivalent Product ID descriptor MSB is assigned '72'. This allows simpler distinction between the USB2.0 portion of the hub and the USB3.2 portion of the hub.

TABLE 49: DEVICE ID LSB

DID_LSB OFFSET: 3004h RESET = XXh			Device ID LSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	DID_LSB	R/W	Least Significant Byte of the Hub Device ID. This is a 16-bit device release number in BCD format assigned by OEM. This value will vary by part number and firmware/configuration revision.

TABLE 50: DEVICE ID MSB

DID_MSB OFFSET: 3005h RESET = XXh			Device ID MSB Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	DID_MSB	R/W	Most Significant Byte of the Hub Device ID. This is a 16-bit device release number in BCD format assigned by OEM. This value will vary by part number and firmware/configuration revision.

TABLE 51: HUB CONFIGURATION DATA BYTE 1

HUB_CFG1 OFFSET: 3006h RESET = 00h(3006h)			Hub Configuration Data Byte 1 Base Address: BF80_0000h
Bit	Name	R/W	Description
7	SELF_BUS_PWR	R/W	Self or Bus Power: Selects between self- and bus-powered operation. The Hub is either self-powered (draws less than 2 mA of upstream bus power) or bus-powered (limited to 100 mA maximum of upstream power prior to being configured by the host controller). When configured as a bus-powered device, the Microchip hub consumes less than 100 mA of current prior to being configured. After configuration, the bus-powered Microchip hub (along with all associated hub circuitry, any embedded devices if part of a compound device, and 100 mA per externally available downstream port) must consume no more than 500 mA of upstream VBUS current. The current consumption is system-dependent, and the OEM must ensure that the USB2.0 specifications are not violated. When configured as a self-powered device, less than 1 mA of upstream VBUS current is consumed and all ports are available, with each port being capable of sourcing 500 mA of current. 0 = Bus-powered operation 1 = Self-powered operation
6	VSM_DISABLE	R/W	0 = VSM Messaging is supported. 1 = VSM Messaging is disabled. When VSM is disabled, all vendor-specific messaging to the hub endpoint will be ignored with no ill effect.

TABLE 51: HUB CONFIGURATION DATA BYTE 1 (CONTINUED)

HUB_CFG1 OFFSET: 3006h RESET = 00h(3006h)			Hub Configuration Data Byte 1 Base Address: BF80_0000h
Bit	Name	R/W	Description
5	HS_DISABLE	R/W	High-Speed Disable: Disables the capability to attach as either a High-Speed or Full-Speed device, and forces attachment as Full-Speed only (that is, no High-Speed support). 0 = High-Speed/Full-Speed 1 = Full-Speed-Only (High-Speed disabled!)
4	MTT_ENABLE	R/W	Multi-TT Enable: Enables one transaction translator per port operation. Selects between a mode where only one transaction translator is available for all ports (Single-TT), or each port gets a dedicated transaction translator (Multi-TT). The host may force Single-TT mode only. 0 = Single TT for all ports 1 = One TT per port (multiple TT's supported)
3	EOP_DISABLE	R/W	EOP Disable: Disables EOP generation of EOF1 when in Full-Speed mode. During FS operation only, this permits the hub to send EOP if no downstream traffic is detected at EOF1. See <i>Section 11.3.1</i> of the <i>USB 2.0 Specification</i> for additional details. Note that generation of an EOP at the EOF1 point may prevent a host controller (operating in FS mode) from placing the USB bus in suspend. 0 = An EOP is generated at the EOF1 point if no traffic is detected. 1 = EOP generation at EOF1 is disabled. This is a normal USB operation.
2:1	CURRENT_SNS	R/W	Over Current Sense: Selects current sensing on a port-by-port basis, all ports ganged, or none (only for bus-powered hubs). The ability to support current sensing on a port or ganged basis is hardware implementation dependent. 00 = Ganged sensing (all ports together). The OCS source select registers need to be updated to select the OCS ganged input. 01 = Individual port-by-port 1x = Over current sensing not supported (must only be used with Bus-Powered configurations)
0	PORT_PWR	R/W	Port Power Switching: Enables power switching on all ports simultaneously (ganged), or port power is individually switched on and off on a port-by-port basis (individual). The ability to support power enabling on a port or ganged basis is hardware implementation dependent. 0 = Ganged switching (all ports together) 1 = Individual port-by-port switching

TABLE 52: HUB CONFIGURATION DATA BYTE 2

HUB_CFG2 OFFSET: 3007h RESET = 00h			Hub Configuration Data Byte 2 Base Address: BF80_0000h
Bit	Name	R/W	Description
7:6	Reserved	R/W	Reserved
5:4	OC_TIMER	R/W	Over Current Timer: Over Current Timer delay. This measures the minimum pulse width for which a pulse is considered valid. 00 = 50 ns 01 = 100 ns 10 = 200 ns 11 = 400 ns
3	COMPOUND	R/W	Compound Device: Allows the OEM to indicate that the Hub is part of a compound device (See the USB specification for definition). The applicable ports must also be defined as having a “Non-Removable Device.” When configured via strapping options, declaring a port as non-removable automatically causes the hub controller to report that it is part of a compound device. 0 = No. 1 = Yes, the Hub is part of a compound device.
2:0	Reserved	R/W	Always read ‘0’

TABLE 53: HUB CONFIGURATION DATA BYTE 3

HUB_CFG3 OFFSET: 3008h RESET = 00h			Hub Configuration Data Byte 3 Base Address: BF80_0000h
Bit	Name	R/W	Description
7:4	Reserved	R/W	Reserved
3	PRTMAP_EN	R/W	Port Re-Mapping enable: Selects the method used by the hub to assign port numbers and disable ports. ‘0’ = Standard mode. Strap options or the following registers are used to define which ports are enabled, and the port mapped as Port ‘n’ on the hub is reported as Port ‘n’ to the host. Unless one of the ports is disabled, the higher numbered ports are remapped to report contiguous port numbers to the host. ‘1’ = Port Re-Map mode. The mode enables remapping via the registers defined below. Disable the LPM to use this feature in USB2 Hub Control .
2:1	Reserved	R/W	Always read ‘0’
0	STRING_EN	R/W	Enables String Descriptor Support ‘0’ = String Support Disabled ‘1’ = String Support Enabled

TABLE 54: USB2 HUB NON-REMOVABLE DEVICE

USB2_HUB_NRD OFFSET: 3009h RESET = XXh			USB2 Hub Non-Removable Device Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	HUB_NON_REM	R/W	<p>Non-Removable Device: Indicates which PHYSICAL ports include non-removable devices. '0' = Port is removable. '1' = Port is non-removable.</p> <p>Informs the Host if one of the active ports has a permanent device that is non-detachable from the Hub. The device must provide its own descriptor data. Bit 7 = 1; PHYSICAL Port 7 is non-removable. Bit 6 = 1; PHYSICAL Port 6 is non-removable. Bit 5 = 1; PHYSICAL Port 5 is non-removable. Bit 4 = 1; PHYSICAL Port 4 is non-removable. Bit 3 = 1; PHYSICAL Port 3 is non-removable. Bit 2 = 1; PHYSICAL Port 2 is non-removable. Bit 1 = 1; PHYSICAL Port 1 is non-removable. Bit 0 = Reserved, always = '0'</p> <p>When using the CFG_NON_REM strap, the port configuration is selected by the resistor used as follows: 200K PD – All removable 200K PU – Port 1 non-removable 10K PD – Ports 1, 2 non-removable 10K PU – Ports 1, 2, 3 non-removable 10R PD – Ports 1, 2, 3, 4 non-removable 10R PU – Ports 1, 2, 3, 4, 5, 6 non-removable No resistor – Not allowed</p> <p>The default value of this register depends on the product number and GFG_NON_REM strap setting.</p>

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 55: PORT DISABLE – SELF POWERED

PORT_DIS_S OFFSET: 300Ah RESET = 00h			Port Disable for Self-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PORT_DIS_SELF	R/W	<p>Port Disable Self-Powered: Disables 1 or more ports. '0' = Port is available. '1' = Port is disabled.</p> <p>During self-powered operation, when PRTMAP_EN = 0, this selects the PHYSICAL ports that are permanently disabled and are not available to be enabled or enumerated by a host controller. The ports can be disabled in any order. The internal logic automatically reports the correct number of enabled ports to the USB host and reorders the active ports to ensure proper function.</p> <p>When using the internal default option, the PRT_DIS[1:0] pins disable the appropriate ports.</p> <p>Bit 7 = 1; PHYSICAL Port 7 is disabled. Bit 6 = 1; PHYSICAL Port 6 is disabled. Bit 5 = 1; PHYSICAL Port 5 is disabled. Bit 4 = 1; PHYSICAL Port 4 is disabled. Bit 3 = 1; PHYSICAL Port 3 is disabled. Bit 2 = 1; PHYSICAL Port 2 is disabled. Bit 1 = 1; PHYSICAL Port 1 is disabled. Bit 0 = Reserved, always = '0'</p>

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 56: PORT DISABLE – BUS POWERED

PORT_DIS_B OFFSET: 300Bh RESET = 00h			Port Disable for Bus-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PORT_DIS_BUS	R/W	<p>Port Disable Bus-Powered: Disables 1 or more ports. '0' = Port is available. '1' = Port is disabled.</p> <p>During Bus-Powered operation, when PRTMAP_EN = 0, this selects the PHYSICAL ports that are permanently disabled and are not available to be enabled or enumerated by a host controller. The ports can be disabled in any order. The internal logic automatically reports the correct number of enabled ports to the USB host and reorders the active ports to ensure proper function.</p> <p>When using the internal default option, the PRT_DIS[1:0] pins disable the appropriate ports.</p> <p>Bit 7 = 1; PHYSICAL Port 7 is disabled. Bit 6 = 1; PHYSICAL Port 6 is disabled. Bit 5 = 1; PHYSICAL Port 5 is disabled. Bit 4 = 1; PHYSICAL Port 4 is disabled. Bit 3 = 1; PHYSICAL Port 3 is disabled. Bit 2 = 1; PHYSICAL Port 2 is disabled. Bit 1 = 1; PHYSICAL Port 1 is disabled. Bit 0 = Reserved, always = '0'</p>

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 57: HUB MAX POWER – SELF POWERED

H_MAXP_S OFFSET: 300Ch RESET = 01h			Max Current for Self-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	MAX_PWR_SP	R/W	<p>Max Power Self-Powered: Value in 2 mA increments that the hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0 mA in its descriptors.</p> <p>The USB2.0 specification does not permit this value to exceed 100 mA.</p>

TABLE 58: HUB MAX POWER – BUS POWERED

H_MAXP_B OFFSET: 300Dh RESET = 50h			Max Current for Bus-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	MAX_PWR_BP	R/W	Max Power Bus-Powered: Value in 2 mA increments that the hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0 mA in its descriptors.

TABLE 59: HUB FEATURE CONTROLLER MAX CURRENT – SELF POWERED

HC_MAXP_S OFFSET: 300Eh RESET = 01h			Hub Feature Controller Max Current for Self-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	HC_MAX_C_SP	R/W	Hub Feature Controller Max Current Self-Powered: Value in 1 mA increments that the hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device. The USB2.0 specification does not permit this value to exceed 100 mA.

TABLE 60: HUB FEATURE CONTROLLER MAX CURRENT – BUS POWERED

HC_MAXP_B OFFSET: 300Fh RESET = 50h			Hub Feature Controller Max Current for Bus-Powered Operation Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	HC_MAX_C_BP	R/W	Hub Feature Controller Max Current Bus-Powered: Value in 1 mA increments that the hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device.

TABLE 61: POWER-ON TIME REGISTER

PWR_ON_TIME OFFSET: 3010h RESET = FAh			Power-On Time Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	POWER_ON_TIME	R/W	Power On Time: The length of time that it takes (in 2 ms intervals) from the time the host initiated power-on sequence begins on a port until power is good on that port. The system software uses this value to determine how long to wait before accessing a powered-on port.

TABLE 62: USB2.0 HUB MANUFACTURER STRING INDEX REGISTER

MFR_STR_INDEX OFFSET: 3013h RESET = 01h			USB2.0 Hub Manufacturer String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	MFR_STR_INDEX	R/W	Manufacturer String Index

TABLE 63: USB2.0 HUB PRODUCT STRING INDEX REGISTER

PRD_STR_INDEX OFFSET: 3014h RESET = 02h			USB2.0 Hub Product String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PRD_STR_INDEX	R/W	Product String Index

TABLE 64: USB2.0 HUB SERIAL STRING INDEX REGISTER

SER_STR_INDEX OFFSET: 3015h RESET = 00h			USB2.0 Hub Serial String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	SER_STR_INDEX	R/W	Serial String Index

TABLE 65: BATTERY CHARGING ENABLE STATUS REGISTER

BC_EN Offset: 30D0h RESET = XXh			Battery Charging Enable Status Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7	Reserved	R	Always 0
6:1	BC_EN_STAT	R	<p>'0' = Battery Charging is OFF '1' = Battery Charging is ON</p> <p>Bit 6 = PHYSICAL Port 6 Bit 5 = PHYSICAL Port 5 Bit 4 = PHYSICAL Port 4 Bit 3 = PHYSICAL Port 3 Bit 2 = PHYSICAL Port 2 Bit 1 = PHYSICAL Port 1</p> <p>The default state of the register depends on the CFG_BC_EN strap setting.</p> <p>When using the CFG_BC_EN strap, the port configuration is selected by the resistor used as follows: 200K PD – Battery charging is disabled on all ports. 200K PU – Port 1 BC is enabled. 10K PD – Ports 1, and 2 BC are enabled. 10K PU – Ports 1, 2, and 3 BC are enabled. 10R PD – Ports 1, 2, 3, and 4 BC are enabled. 10R PU – Ports 1, 2, 3, 4, 5, and 6 BC are enabled. No resistor – Not allowed</p> <p>See Note 1.</p>
0	Reserved	R	Always 0

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 66: START OCS LOCKOUT TIMER REGISTER

OCS_LOCKOUT OFFSET: 30E1h RESET = 0Ah			Start OCS Lockout Timer Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	START_OCS_LOCK	R/W	This timer blocks OCS events after the port power is enabled and is specified in 1 ms increments.

TABLE 67: PORT POWER STATUS

PORT_PWR_STAT OFFSET: 30E5h RESET = 00h			Port Power Status Base Address: BF80_0000h
Bit	Name	R/W	Description
7:5	Reserved	R	Always 0
7:1	BPRTWPWR[4:1]	R	'0' = State of Port Power Enable is OFF '1' = State of Port Power Enable is ON Bit 7 = PHYSICAL Port 7 Bit 6 = PHYSICAL Port 6 Bit 5 = PHYSICAL Port 5 Bit 4 = PHYSICAL Port 4 Bit 3 = PHYSICAL Port 3 Bit 2 = PHYSICAL Port 2 Bit 1 = PHYSICAL Port 1 See Note 1 .
0	Reserved	R	Always 0

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 68: USB2 TEST MODE REGISTER

USB2_TEST_MODE OFFSET: 30E6h RESET = 00h			USB2 Test Mode Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7	Reserved	R	Always 0
6:1	H_DN_STATE_PORT_TES	R	'0' = Port is not in a USB2.0 Test mode. Bit 6 = 1; PHYSICAL Port 6 is in a USB2.0 Test mode. Bit 5 = 1; PHYSICAL Port 5 is in a USB2.0 Test mode. Bit 4 = 1; PHYSICAL Port 4 is in a USB2.0 Test mode. Bit 3 = 1; PHYSICAL Port 3 is in a USB2.0 Test mode. Bit 2 = 1; PHYSICAL Port 2 is in a USB2.0 Test mode. Bit 1 = 1; PHYSICAL Port 1 is in a USB2.0 Test mode. See Note 1 .
0	UP_STAT_TEST_MODE	R	'0' = Upstream port is not in a USB2.0 Test mode. '1' = Upstream port is in a USB2.0 Test mode.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 69: LPM TURNAROUND TIMEOUT

HS_TRESP_TIMEOUT OFFSET: 30E7h RESET = 00h			LPM Turnaround Timeout Register Base Address: BF80_0000h
Bit	Name	R/W	Description
6:0	LPM_TIMEOUT	R/W	This register sets the number of clocks the LPM logic will wait before timing out an LPM transaction on a downstream port. When this register is left at '0', a default value of 0x25 will be used. When this register holds a non-zero value, the register value is used.

TABLE 70: ENABLE OCS LEGACY REGISTER

ENABLE_OCS_LEGACY OFFSET: 30E9h RESET = 00h			Enable OCS Legacy Base Address: BF80_0000h
Bit	Name	R/W	Description
7:3	Reserved	R	Reserved; do not modify
2	ENABLE_OCS_LEGACY	R/W	—
1:0	Reserved	R	Reserved; do not modify

TABLE 71: OCS MINIMUM WIDTH REGISTER

OCS_MIN_WIDTH OFFSET: 30EAh RESET = 05h			OCS Minimum Width Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	OCS_MIN_WIDTH	R/W	Contains the minimum OCS pulse width required to detect an OCS event. This field provides a range from 0 to 5 milliseconds in 1 ms increments.

TABLE 72: OCS INACTIVE TIMER

OCS_INACTIVE_TIMER OFFSET: 30EBh RESET = 14h			OCS Inactive Timer After First OCS Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	OCS_INACTIVE	R/W	Contains the maximum delay between two consecutive OCS pulses to occur to register as an OCS event. This field provides a range from 0 to 255 milliseconds in 1 ms increments.

TABLE 73: HUB PORT SWAP REGISTER

HUB_PRT_SWAP OFFSET: 30FAh RESET = 00h			Hub Port Swap Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PRT_SWAP	R/W	<p>Port Swap: Swaps the upstream and downstream USB DP and DM pins for ease of board routing to devices and connectors.</p> <p>'0' = USB D+ functionality is associated with the DP pin, and D- functionality is associated with the DM pin.</p> <p>'1' = USB D+ functionality is associated with the DM pin, and D- functionality is associated with the DP pin.</p> <p>Bit 5 = '1': PHYSICAL Port 5 DP/DM is Swapped. Bit 4 = '1': PHYSICAL Port 4 DP/DM is Swapped. Bit 3 = '1': PHYSICAL Port 3 DP/DM is Swapped. Bit 2 = '1': PHYSICAL Port 2 DP/DM is Swapped. Bit 1 = '1': PHYSICAL Port 1 DP/DM is Swapped. Bit 0 = '1': PHYSICAL Port 0 (Upstream) Port DP/DM is Swapped.</p>

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 74: HUB PORT REMAP 1-2 REGISTER

HUB_PRT_REMAP_12 OFFSET: 30FBh RESET = 00h			Hub Port 1-2 Remap Base Address: BF80_0000h
Bit	Name	R/W	Description
7:4	PRT_2_MAP	R/W	<p>0000b – Physical Port 2 is disabled. 0001b – Physical Port 2 is mapped to Logical Port 1. 0010b – Physical Port 2 is mapped to Logical Port 2. 0011b – Physical Port 2 is mapped to Logical Port 3. 0100b – Physical Port 2 is mapped to Logical Port 4. 0101b – Physical Port 2 is mapped to Logical Port 5. 0110b – Physical Port 2 is mapped to Logical Port 6. 0111b – Physical Port 2 is mapped to Logical Port 7.</p> <p>All other values default to 0000b value.</p>
3:0	PRT_1_MAP	R/W	<p>0000b – Physical Port 1 is disabled. 0001b – Physical Port 1 is mapped to Logical Port 1. 0010b – Physical Port 1 is mapped to Logical Port 2. 0011b – Physical Port 1 is mapped to Logical Port 3. 0100b – Physical Port 1 is mapped to Logical Port 4. 0101b – Physical Port 1 is mapped to Logical Port 5. 0110b – Physical Port 1 is mapped to Logical Port 6. 0111b – Physical Port 1 is mapped to Logical Port 7.</p> <p>All other values default to 0000b value.</p>

Note 1: Writes to this register are disabled unless PRTMAP_EN bit in HUB_CFG_3 is set.

TABLE 75: HUB PORT REMAP 3-4 REGISTER

HUB_PRT_REMAP_34 OFFSET: 30FCh RESET = 00h			Hub Port 3-4 Remap Base Address: BF80_0000h
Bit	Name	R/W	Description
7:4	PRT-4_MAP	R/W	0000b – Physical Port 4 is disabled. 0001b – Physical Port 4 is mapped to Logical Port 1. 0010b – Physical Port 4 is mapped to Logical Port 2. 0011b – Physical Port 4 is mapped to Logical Port 3. 0100b – Physical Port 4 is mapped to Logical Port 4. 0101b – Physical Port 4 is mapped to Logical Port 5. 0110b – Physical Port 4 is mapped to Logical Port 6. 0111b – Physical Port 4 is mapped to Logical Port 7. All other values default to 0000b value.
3:0	PRT-3_MAP	R/W	0000b – Physical Port 3 is disabled. 0001b – Physical Port 3 is mapped to Logical Port 1. 0010b – Physical Port 3 is mapped to Logical Port 2. 0011b – Physical Port 3 is mapped to Logical Port 3. 0100b – Physical Port 3 is mapped to Logical Port 4. 0101b – Physical Port 3 is mapped to Logical Port 5. 0110b – Physical Port 3 is mapped to Logical Port 6. 0111b – Physical Port 3 is mapped to Logical Port 7. All other values default to 0000b value.

Note 1: Writes to this register are disabled unless PRTMAP_EN bit in HUB_CFG_3 is set.

TABLE 76: HUB PORT REMAP 5-6 REGISTER

HUB_PRT_REMAP_56 OFFSET: 30FDh RESET = 00h			Hub Port 5-6 Remap Base Address: BF80_0000h
Bit	Name	R/W	Description
7:4	PRT-6_MAP	R/W	0000b – Physical Port 6 is disabled. 0001b – Physical Port 6 is mapped to Logical Port 1. 0010b – Physical Port 6 is mapped to Logical Port 2. 0011b – Physical Port 6 is mapped to Logical Port 3. 0100b – Physical Port 6 is mapped to Logical Port 4. 0101b – Physical Port 6 is mapped to Logical Port 5. 0110b – Physical Port 6 is mapped to Logical Port 6. 0111b – Physical Port 6 is mapped to Logical Port 7. All other values default to 0000b value.
3:0	PRT-5_MAP	R/W	0000b – Physical Port 5 is disabled. 0001b – Physical Port 5 is mapped to Logical Port 1. 0010b – Physical Port 5 is mapped to Logical Port 2. 0011b – Physical Port 5 is mapped to Logical Port 3. 0100b – Physical Port 5 is mapped to Logical Port 4. 0101b – Physical Port 5 is mapped to Logical Port 5. 0110b – Physical Port 5 is mapped to Logical Port 6. 0111b – Physical Port 5 is mapped to Logical Port 7. All other values default to 0000b value.

Note 1: Writes to this register are disabled unless PRTMAP_EN bit in HUB_CFG_3 is set.

TABLE 77: HUB PORT REMAP 7 REGISTER

HUB_PRT_REMAP_7 OFFSET: 30FEh RESET = 00h			Hub Port 7 Remap Base Address: BF80_0000h

7:6	Reserved	R	Reserved

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 83: EMBEDDED HUB TEST PORT SELECT (CONTINUED)

EMBED_TEST_PORT_SEL OFFSET: 318Dh RESET = 00h			Hub Test Port Select Base Address: BF80_0000h
Bit	Name	R/W	Description
5:0	PORT_SEL[4:0]	R/W	<p>Enables a port at the particular bit position. Any combination is permissible. Some examples are shown below:</p> <p>00_0000 – Normal operation</p> <p>00_0001 – PHYSICAL Downstream Port 1</p> <p>00_0010 – PHYSICAL Downstream Port 2</p> <p>00_0100 – PHYSICAL Downstream Port 3</p> <p>00_1000 – PHYSICAL Downstream Port 4</p> <p>01_0000 – PHYSICAL Downstream Port 5</p> <p>00_0011 – PHYSICAL Downstream Port 1 and Port 2</p> <p>00_0111 – PHYSICAL Downstream Port 1-3</p> <p>00_1111 – PHYSICAL Downstream Port 1-4</p> <p>11_1111 – PHYSICAL Downstream Port 1-6</p> <p>To enable testing of the upstream port, use FlexConnect to swap Port 1 with the upstream port, and then run the EMBEDTEST on Port 1. See Note 1.</p>

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. The PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 84: USB2 HUB STATUS REGISTER

USB2_HUB_STAT OFFSET: 3194h RESET = 00h			USB2 Hub Status Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:1	USB2_DN_CONNECTED	R	USB Device connected on downstream port '1' = Device connected '0' = No device connected Bit 7 = PHYSICAL Port 7 Bit 6 = PHYSICAL Port 6 Bit 5 = PHYSICAL Port 5 Bit 4 = PHYSICAL Port 4 Bit 3 = PHYSICAL Port 3 Bit 2 = PHYSICAL Port 2 Bit 1 = PHYSICAL Port 1 See Note 1 .
0	USB2_HOST_DETECT	R	'1' = USB2 Host connected '0' = No USB2 host connected

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 85: USB2 DOWNSTREAM DEVICE SPEED[4-1]

USB2_DN_SPEED41 OFFSET: 3195h RESET = 00h			USB2 Downstream Device Speed1 Base Address: BF80_0000h
Bit	Name	R/W	Description
7:6	USB2_DN4_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 4 00b – No connect 01b – LS 10b – FS 11b – HS
5:4	USB2_DN3_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 3 00b – No connect 01b – LS 10b – FS 11b – HS
3:2	USB2_DN2_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 2 00b – No connect 01b – LS 10b – FS 11b – HS
1:0	USB2_DN1_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 1 00b – No connect 01b – LS 10b – FS 11b – HS

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 86: USB2 DOWNSTREAM DEVICE SPEED[7-5]

USB2_DN_SPEED75 OFFSET: 3196h RESET = 00h			USB2 Downstream Device Speed2 Base Address: BF80_0000h
Bit	Name	R/W	Description
7:2	Reserved	R	Always reads 0
5:4	USB2_DN7_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 7 00b – No connect 01b – LS 10b – FS 11b – HS

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 86: USB2 DOWNSTREAM DEVICE SPEED[7-5] (CONTINUED)

USB2_DN_SPEED75 OFFSET: 3196h RESET = 00h			USB2 Downstream Device Speed2 Base Address: BF80_0000h
Bit	Name	R/W	Description
3:2	USB2_DN6_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 6 00b – No connect 01b – LS 10b – FS 11b – HS
1:0	USB2_DN5_DEV_SPEED	R	Indicates the USB2.0 state of PHYSICAL downstream Port 5 00b – No connect 01b – LS 10b – FS 11b – HS

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 87: USB2 SUSPEND INDICATOR

USB2_SUSP_IND OFFSET: 3197h RESET = 00h			USB2 Suspend Indicator Base Address: BF80_0000h
Bit	Name	R/W	Description
7:1	Reserved	R	Always reads 0. Do not modify.
0	USB_SUSPEND	R	Suspend indicator 0 = Active. The hub is configured and operational. 1 = Inactive. The hub is not configured, or configured and is suspended in Sleep state.

TABLE 88: USB2 SUSPEND INDICATOR

USB2_SUSP_IND OFFSET: 3197h RESET = 00h			USB2 Suspend Indicator Base Address: BF80_0000h
Bit	Name	R/W	Description
7:1	Reserved	R	Always reads 0. Do not modify.
0	USB_SUSPEND	R	Suspend indicator 0 = Active. The hub is configured and operational. 1 = Inactive. The hub is not configured, or configured and is suspended in Sleep state.

TABLE 89: USB GEN2 HUB CONTROL REGISTER

USB3_GEN2_HUB_CTRL_REG 0xBF80_392Ch Reset = 0x00000000			GEN2 Hub Control Register
Bit	Name	R/W	Description

TABLE 89: USB GEN2 HUB CONTROL REGISTER (CONTINUED)

USB3_GEN2_HUB_CTRL_REG 0xBF80_392Ch Reset = 0x00000000			GEN2 Hub Control Register
31:14	Reserved	R	Always '0'
13	HOST_FORCE_GEN1_SPEED_P5	R	Port 5 USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
12	HOST_FORCE_GEN1_SPEED_P4	R	Port 4 USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
11	HOST_FORCE_GEN1_SPEED_P3	R	Port 3 USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
10	HOST_FORCE_GEN1_SPEED_P2	R	Port 2 USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
9	HOST_FORCE_GEN1_SPEED_P1	R	Port 1 USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
8	HOST_FORCE_GEN1_SPEED_P0	R	It is not recommended to modify this bit. Port 0 (upstream port) USB Super Speed link Gen1 Link Speed Control: 0: Max Link Speed is Gen2. 1: Max Link Speed is Gen1.
7:0	Reserved	R	Always '0'

TABLE 90: PORT 0 (UPSTREAM) PORT POWER SELECT

PORT_CFG_SEL_0 OFFSET: 3C00h RESET = 80h			PHYSICAL Port 0 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
31:23	Reserved	R	Always reads 0. Do not modify.
22	ORIENTATION_POLARITY	R/W	This bit indicates/controls the Type-C orientation of the port. This register bit is controlled by the firmware and should not be modified externally under normal-use cases.
21	CC_ENABLE	R/W	This bit controls the Enable to CC Pin Detection logic. This should always be enabled for Type-C ports. This register bit is controlled by the firmware and should not be modified externally under normal-use cases.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 90: PORT 0 (UPSTREAM) PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_0 OFFSET: 3C00h RESET = 80h			PHYSICAL Port 0 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
20:16	Reserved	R	Always reads 0. Do not modify.
15	MUX_EN	R/W	Enables the internal MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = Port MUX disabled 1 = Port MUX enabled
14	Reserved	R	Always reads 0. Do not modify.
13:12	C_MUX_SEL[1:0]	R/W	Control mode for the MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 00 = Firmware controls attach and orientation (This mode used for Power Delivery enabled ports.). 01 = Firmware controls C_ATTACH, hardware logic controls ORIENTATION. (Used in custom application only) 10 = Firmware controls ORIENTATION, hardware logic controls C_ATTACH. (Used in custom application only) 11 = Hardware logic controls C_ATTACH and ORIENTATION. This mode is used for standard Type-C ports with no PD enabled.)
11	C_SEL_BNA	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls which USB3.1 PHY is selected for the Type-C attach orientation. This bit is valid only if MUX_EN = 1 and PORT_TYPE = Type-C. 0 = PHY side 'A' is selected. 1 = PHY side 'B' is selected.
10	C_ATTACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls if a Type-C attach is detected. 0 = No Type-C attach 1 = Type-C attach detected.
9:8	PORT_TYPE	R/W	Indicates the type of USB receptacle used on the port 00 = Type-A with USB2 and USB3 01 = Type-C with USB2 and USB3 10 = Split. Type-A USB2 only, internal (embedded device) USB3 11 = Split. Type-C USB2 only, internal (embedded device) USB3

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 90: PORT 0 (UPSTREAM) PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_0 OFFSET: 3C00h RESET = 80h			PHYSICAL Port 0 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
7	COMBINED_MODE	R/W	This should always be set to 1 for the standard-use case as both pins are always physically bonded out the same pin in the package. 0 = The Port Power and Overcurrent Sense functions use separate physical pins. 1 = The Port Power and Overcurrent Sense functions use the same physical pin.
6	GANG_PIN	R/W	When set, the port power will be connected to the GANG_PWR pin.
5	DISABLED	R/W	When set, it disables the port. Used to inform the USB hub that a port is permanently disabled.
4	PERMANENT	R/W	When set, it indicates that the port has a permanently attached device.
3:0	PRT_SEL	R/W	This selects the source for PRT_CTL1. 0000b = The port power is disabled. 0001b = The port is on if the USB2 port power is on (enable port power command received from USB2 host). 0010b = The port is on if the USB3 port power is on (enable port power command received from USB3 host). 0011b = The port is on if the USB2 or USB3 port power is on (enable port power command received from USB2 or USB3 host). 0100b = The port is on if the designated GPIO is on (change PRT_CTL pin to GPIO mode for external control via USB register write or SMBus/I ² C register write). All other values are reserved.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 91: PORT 1 PORT POWER SELECT

PORT_CFG_SEL_1 OFFSET: 3C04h RESET = 80h			PHYSICAL Port 1 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
31:23	Reserved	R	Always reads 0. Do not modify.
22	ORIENTATION_POLARITY	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls the Type-C orientation of the port.
21	CC_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit controls the Enable to CC Pin Detection logic. This should always be enabled for Type-C ports.
20	AUTO_DETACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. When this bit is set, the MINIHOST_CONNECT bits will be set to 000b automatically when a device detach is detected.
19:17	MINIHOST_CONNECT[2:0]	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 000 = Neutral condition (Disconnected state) 001 = Port is connected to Mini-Host. 010 = Port is connected to the USB2 hub in USB1.1 mode. 011 = Port is connected in USB2 mode. 100 = Port is connected in USB3.1 Gen 1 mode. Others are reserved.
16	MINI_HOST_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = The port is a standard USB port connected to the USB hub. 1 = The port is under control by the Mini-Host.
15	MUX_EN	R/W	Enables the internal MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = Port MUX disabled 1 = Port MUX enabled
14	Reserved	R	Always reads 0. Do not modify.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 91: PORT 1 PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_1 OFFSET: 3C04h RESET = 80h			PHYSICAL Port 1 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
13:12	C_MUX_SEL[1:0]	R/W	Control mode for the MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 00 = Firmware controls attach and orientation. (This mode is used for Power Delivery enabled ports.) 01 = Firmware controls C_ATTACH, hardware logic controls ORIENTATION. (Used in custom application only) 10 = Firmware controls ORIENTATION, hardware logic controls C_ATTACH. (Used in custom application only) 11 = Hardware logic controls C_ATTACH and ORIENTATION. (This mode is used for standard Type-C ports with no PD enabled.)
11	C_SEL_BNA	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls which USB3.1 PHY is selected for the Type-C attach orientation. This bit is valid only if MUX_EN = 1 and PORT_TYPE = Type-C. 0 = PHY side 'A' is selected. 1 = PHY side 'B' is selected.
10	C_ATTACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls if a Type-C attach is detected. 0 = No Type-C attach 1 = Type-C attach detected
9:8	PORT_TYPE	R/W	Indicates the type of USB receptacle used on the port. 00 = Type-A with USB2 and USB3 01 = Type-C with USB2 and USB3 10 = Split. Type-A USB2 only, internal (embedded device) USB3 11 = Split. Type-C USB2 only, internal (embedded device) USB3

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 91: PORT 1 PORT POWER SELECT (CONTINUED)

See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 93: PORT 3 PORT POWER SELECT

PORT_CFG_SEL_3 OFFSET: 3C0Ch RESET = 80h			PHYSICAL Port 3 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
31:23	Reserved	R	Always reads 0. Do not modify.
22	ORIENTATION_POLARITY	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls the Type-C orientation of the port.
21	CC_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit controls the Enable to CC Pin Detection logic. This should always be enabled for Type-C ports.
20	AUTO_DETACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. When this bit is set, the MINIHOST_CONNECT bits will be set to 000b automatically when a device detach is detected.
19:17	MINIHOST_CONNECT[2:0]	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 000 = Neutral condition (Disconnected state) 001 = The port is connected to Mini-Host. 010 = The port is connected to the USB2 hub in USB1.1 mode. 011 = The port is connected in USB2 mode. 100 = The port is connected in USB3.1 Gen 1 mode. Others are reserved.
16	MINI_HOST_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = The port is a standard USB port connected to the USB hub. 1 = The port is under control by the Mini-Host.
15	MUX_EN	R/W	This enables the internal MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = Port MUX disabled 1 = Port MUX enabled
14	Reserved	R	Always reads 0. Do not modify.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 93: PORT 3 PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_3 OFFSET: 3C0Ch RESET = 80h			PHYSICAL Port 3 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
13:12	C_MUX_SEL[1:0]	R/W	Control mode for the MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 00 = Firmware controls attach and orientation. (This mode is used for Power Delivery enabled ports.) 01 = Firmware controls C_ATTACH, hardware logic controls ORIENTATION. (Used in custom application only) 10 = Firmware controls ORIENTATION, hardware logic controls C_ATTACH. (Used in custom application only) 11 = Hardware logic controls C_ATTACH and ORIENTATION. (This mode used for standard Type-C ports with no PD enabled.)
11	C_SEL_BNA	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls which USB3.1 PHY is selected for the Type-C attach orientation. This bit is valid only if MUX_EN = 1 and PORT_TYPE = Type-C. 0 = PHY side 'A' is selected. 1 = PHY side 'B' is selected.
10	C_ATTACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls if a Type-C attach is detected. 0 = No Type-C attach 1 = Type-C attach detected
9:8	PORT_TYPE	R/W	Indicates the type of USB receptacle used on the port 00 = Type-A with USB2 and USB3 01 = Type-C with USB2 and USB3 10 = Split. Type-A USB2 only, internal (embedded device) USB3 11 = Split. Type-C USB2 only, internal (embedded device) USB3

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 93: PORT 3 PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_3 OFFSET: 3C0Ch RESET = 80h			PHYSICAL Port 3 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
7	COMBINED_MODE	R/W	This should always be set to 1 for the standard-use case as both pins are always physically bonded out the same pin in the package. 0 = The Port Power and Overcurrent Sense functions use separate physical pins. 1 = The Port Power and Overcurrent Sense functions use the same physical pin.
6	GANG_PIN	R/W	When set, the port power will be connected to the GANG_PWR pin.
5	DISABLED	R/W	When set, it disables the port. Used to inform the USB hub that a port is permanently disabled.
4	PERMANENT	R/W	When set, it indicates that the port has a permanently attached device.
3:0	PRT_SEL	R/W	This selects the source for PRT_CTL3. 0000b = The port power is disabled. 0001b = The port is on if the USB2 port power is on. (enable port power command received from USB2 host). 0010b = The port is on if the USB3 port power is on. (enable port power command received from USB3 host). 0011b = The port is on if the USB2 or USB3 port power is on. (enable port power command received from USB2 or USB3 host). 0100b = The port is on if the designated GPIO is on. (change PRT_CTL pin to GPIO mode for external control via USB register write or SMBus/I ² C register write). All other values are reserved.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 94: PORT 4 PORT POWER SELECT

PORT_CFG_SEL_4 OFFSET: 3C10h RESET = 80h			PHYSICAL Port 4 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
31:23	Reserved	R	Always reads 0. Do not modify.
22	ORIENTATION_POLARITY	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls the Type-C orientation of the port.
21	CC_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit controls the Enable to CC Pin Detection logic. This should always be enabled for Type-C ports.
20	AUTO_DETACH	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. When this bit is set, the MINIHOST_CONNECT bits will be set to 000b automatically when a device detach is detected.
19:17	MINIHOST_CONNECT[2:0]	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 000 = Neutral condition (Disconnected state) 001 = The port is connected to Mini-Host. 010 = The port is connected to the USB2 hub in USB1.1 mode. 011 = The port is connected in USB2 mode. 100 = The port is connected in USB3.1 Gen 1 mode. Others are reserved.
16	MINI_HOST_ENABLE	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = The port is a standard USB port connected to the USB hub. 1 = The port is under control by the Mini-Host.
15	MUX_EN	R/W	Enables the internal MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 0 = Port MUX disabled 1 = Port MUX enabled
14	Reserved	R	Always reads 0. Do not modify.

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping. See [Section 7.0, Physical and Logical Port Mapping](#) for details on the LOGICAL vs. PHYSICAL mapping for each device in this family.

TABLE 94: PORT 4 PORT POWER SELECT (CONTINUED)

PORT_CFG_SEL_4 OFFSET: 3C10h RESET = 80h			PHYSICAL Port 4 Power Select Base Address: BF80_0000h
Bit	Name	R/W	Description
13:12	C_MUX_SEL[1:0]	R/W	Control mode for the MUX for Type-C routing of the USB3.1 signals. This register bit is controlled by the firmware and should not be modified externally under normal-use cases. 00 = Firmware controls attach and orientation (this mode used for Power Delivery enabled ports). 01 = Firmware controls C_ATTACH, hardware logic controls ORIENTATION. (Used in custom application only) 10 = Firmware controls ORIENTATION, hardware logic controls C_ATTACH. (Used in custom application only) 11 = Hardware logic controls C_ATTACH and ORIENTATION. (This mode used for standard Type-C ports with no PD enabled.)
11	C_SEL_BNA	R/W	This register bit is controlled by the firmware and should not be modified externally under normal-use cases. This bit indicates/controls which USB3.1 PHY is selected for the Type-C attach orientation. 7:0	USB3_HUB_-DID_MSB	R/W	Least Significant Byte of the HFC Product ID. This is a 16-bit value that identifies the vendor of the product (as registers with USB-IF). The Microchip Vendor ID is 0424h.

TABLE 128: USB3 HUB VENDOR ID MSB

USB3_HUB_VID_MSB OFFSET: 8049h RESET = 04h			USB3 Hub Vendor ID MSB Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_-DID_MSB	R/W	Least Significant Byte of the HFC Product ID. This is a 16-bit value that identifies the vendor of the product (as registers with USB-IF). The Microchip Vendor ID is 0424h.

TABLE 129: USB3 HUB PRODUCT ID LSB

USB3_HUB_PID_LSB OFFSET: 804Ah RESET = XXh			USB3 Hub Product ID LSB Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_PID_MSB	R/W	Most Significant Byte of the USB3 Hub Product ID. This is a 16-bit value that uniquely identifies this USB3 Hub device. The default value is dependent on the part as shown below: USB7202 = 02h USB7206 = 06h USB7250 = 50h USB7251 = 51h USB7252 = 52h USB7256 = 56h

Note 1: If port disable straps are implemented, these values will automatically decrement by the number of ports disabled by strapping. For example, if a design that implements USB7256 with two ports disabled by strapping, the Product ID (PID) will automatically change to 0x7254.

TABLE 130: USB3 HUB PRODUCT ID LSB

USB3_HUB_PID_LSB OFFSET: 804Bh RESET = 72h			USB3 Hub Product ID LSB Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_PID_MSB	R/W	Most Significant Byte of the USB3 Hub Product ID. This is a 16-bit value that uniquely identifies this USB3 Hub device. All devices: 72h

TABLE 131: USB3 HUB DEVICE ID (BCDDEVICE) LSB

USB3_HUB_PID_MSB OFFSET: 804Ch RESET = XXh			USB3 Hub Device ID LSB Base Address: BFCD_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_-DID_LSB	R/W	Least Significant Byte of the USB3 Hub Device ID. This is a 16-bit value that is used for firmware or device revision tracking purposes.

Note 1: The default Device ID may change with silicon or firmware revisions.

TABLE 132: USB3 HUB DEVICE ID (BCDDEVICE) MSB

USB3_HUB_PID_MSB OFFSET: 804Dh RESET = XXh			USB3 Hub Device ID MSB Base Address: BFCD_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_-DID_MSB	R/W	Most Significant Byte of the USB3 Hub Device ID. This is a 16-bit value that is used for firmware or device revision tracking purposes.

Note 1: The default Device ID may change with silicon or firmware revisions.

TABLE 133: USB3 HUB MANUFACTURER STRING INDEX REGISTER

USB3_HUB_MFR_STR_INDEX OFFSET: 804Eh RESET = 03h			USB3 Hub Manufacturer String Index Register Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_MFR_STR_INDEX	R/W	Manufacturer String Index Set = '00b' if unused

TABLE 134: USB3 HUB PRODUCT STRING INDEX REGISTER

USB3_HUB_PRD_STR_INDEX OFFSET: 804Fh RESET = 01h			USB3 Hub Product String Index Register Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_PRD_STR_INDEX	R/W	Product String Index Set = '00b' if unused

TABLE 135: USB3 HUB SERIAL STRING INDEX REGISTER

USB3_HUB_SER_STR_INDEX OFFSET: 8050h RESET = 02h			USB3 Hub Serial String Index Register Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_SER_STR_INDEX	R/W	Serial String Index Set = '00b' if unused

TABLE 136: USB3 HUB LANG_ID[15:0] LANGUAGE IDENTIFIER

USB3_HUB_LANG_ID OFFSET: 80DAh RESET = 0409h			USB3 Hub USB-IF Language Identifier Base Address: BFCF_0000h
Bit	Name	R/W	Description
15:0	USB3_HUB_LANG_ID	R/W	USB-IF Language Identifier. Default is English (United States).

Note 1: 28FAh-[7:0], 28FBh-[15:8]

TABLE 137: USB3 HUB STRING DESCRIPTOR CONTAINER

USB3_HUB_STR_CONTAINER OFFSET: 80E0h			USB3 Hub String Container Base Address: BFCF_0000h
Byte	Name	R/W	Description
95:0	USB3_HUB_STRING	R/W	Container for All HFC Strings. This must follow the formatting as described in the <i>USB2.0 Specification</i> for string descriptors. All Hub Feature Controller product, manufacturer, and serial string are contained within this register array.

Note 1: 80E0h-[7:0], 80E1h-[15:8], 80E2h-[23:16], 80E3h-[31:24], 80E4h-[39:32],... 819Fh-[95:88]

TABLE 3-1: USB3 HUB ATTRIBUTES DESCRIPTOR

USB3_HUB_ATTRIBUTES OFFSET: 805Fh RESET = 60h			USB3 Hub Attributes Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	Reserved	R	Reserved, always set to '1b'
6	SELF_POWERED	R/W	0b = Hub is not self-powered. (Hub is powered from upstream port VBUS.) 1b = Hub is self-powered. (Hub has its own power source.)
5	REMOTE_WAKEUP	R/W	0b = Hub is not remote wakeup capable. 1b = Hub is remote wakeup capable.
4:0	Reserved	R	Reserved, always set to '0b'.

TABLE 138: USB3 HUB MAX POWER DESCRIPTOR

USB3_HUB_MAX_POWER OFFSET: 8060h RESET = 01h			USB3 Hub Max Power Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_MAX- _POWER	R/W	Maximum power consumption of the hub from VBUS when fully operational. 2 mA intervals. The default setting for this value is 2 mA (indicating almost no power consumption from VBUS) as most USB3 hub applications are not bus-powered applications.

TABLE 139: USB3 HUB NUMBER OF PORTS DESCRIPTOR

USB3_HUB_NBR_PORTS OFFSET: 80CAh RESET = XXh			USB3 Hub Number of Ports Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_N- BR_PORTS	R/W	The number of downstream ports on the USB3 side of the hub (does not include any USB2-only ports). The default value depends on the hub device. 00h = Invalid 01h = 1 USB3 downstream port 02h = 2 USB3 downstream ports 03h = 3 USB3 downstream ports 04h = 4 USB3 downstream ports 05h = 5 USB3 downstream ports 06h – FFh = Invalid

TABLE 140: USB3 HUB CHARACTERISTICS DESCRIPTOR

USB3_HUB_CHARACTERISTICS OFFSET: 80CBh RESET = 09h			USB3 Hub Characteristics Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:5	Reserved	R	Reserved

TABLE 140: USB3 HUB CHARACTERISTICS DESCRIPTOR

USB3_HUB_CHARACTERISTICS OFFSET: 80CBh RESET = 09h			USB3 Hub Characteristics Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
4:3	OVER_CURRENT_MODE	R/W	<p>00 = Global over-current protection. The hub reports overcurrent as a summation of all ports' current draw, without a breakdown of individual port over-current status.</p> <p>01b = Individual port overcurrent protection. The hub reports overcurrent on a per-port basis. Each port has an overcurrent status.</p> <p>1Xb = No overcurrent protection. This option is allowed only for bus-powered hubs that do not implement overcurrent protection.</p>
2	COMPOUND_DEVICE	R/W	<p>0b = Hub is not part of a compound device.</p> <p>1b = Hub is part of a compound device. A USB3 device is permanently attached to one or more of the USB3 ports.</p>
1:0	LOGICAL_POWER_MODE	R/W	<p>00 = Ganged power switching. All ports power at once from a single control signal.</p> <p>01b = Individual port power switching. Each port has an individual power switch with individual control signal.</p> <p>1Xb = Reserved</p>

TABLE 141: USB3 HUB POWER-TO-POWER GOOD DESCRIPTOR

USB3_HUB_PWR2PWRGOOD OFFSET: 80CDh RESET = 64h			USB3 Hub Power to Power Good Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_PWR2PWRGOOD	R/W	Time in 2 ms intervals from the time the power-on sequence begins on a port until power is good on that port. The USB system software uses this value to determine how long to wait before accessing a powered-on port. This value should be set to zero if power-switching is not supported in the system design.

Note 1: A 'zero' setting should never be used on a design which includes Type-C ports.

TABLE 142: USB3 HUB CHARACTERISTICS DESCRIPTOR

USB3_HUB_NON_REM OFFSET: 80D2h RESET = 00h			USB3 Hub Non Removable Ports Descriptor Base Address: BFCF_0000h
Bit	Name	R/W	Description
7:0	USB3_HUB_NON_REM	R/W	A descriptor which communicates the non-removable settings for the LOGICAL port numbering. 0b = Device is removable 1b = Device is non-removable Bit 0 – Reserved Bit 1 – Port 1 Bit 2 – Port 2 Bit 3 – Port 2 Bit 4 – Port 2 Bit 5 – Port 2 Bit 6 – Reserved Bit 7 – Reserved

Note 1: Certain port settings are made with respect to LOGICAL port numbering, and other port settings are made with respect to PHYSICAL port numbering. LOGICAL port numbering is the numbering as communicated to the USB host. It is the end result after any port number remapping or port disabling. PHYSICAL port number is the port number with respect to the physical PHY on the chip. PHYSICAL port numbering is fixed, and the settings are not impacted by LOGICAL port renumbering/remapping.

TABLE 143: HFC PRODUCT ID LSB

HFC_PID_LSB OFFSET: 2856h RESET = 4Xh			HFC Product ID LSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_PID_LSB	R/W	Least Significant Byte of the HFC Product ID. This is a 16-bit value that uniquely identifies this HFC device. The default value depends on the features enabled on the device as shown below: I2S Audio only = 42h I2S Audio/HID = 43h CDC = 44h I2S, CDC = 46h I2S Audio/HID, CDC = 47h WinUSB only = 40h I2S Audio, WinUSB = 4Ah I2S Audio/HID, WinUSB = 4Bh WinUSB, CDC = 4Ch I2S Audio, WinUSB, CDC = 4Eh I2S Audio/HID, WinUSB, CDC = 4Fh

TABLE 144: HFC PRODUCT ID MSB

HFC_PID_MSB OFFSET: 2857h RESET = 72h			HFC Product ID MSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_PID_MSB	R/W	Most Significant Byte of the HFC Product ID. This is a 16-bit value that uniquely identifies this HFC device.

TABLE 145: HFC VENDOR ID LSB

HFC_VID_LSB OFFSET: 2864h RESET = 24h			HFC Vendor ID LSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_DID_LSB	R/W	Least Significant Byte of the HFC Product ID. This is a 16-bit value that identifies the vendor of the product (as registers with USB-IF).

TABLE 146: HFC VENDOR ID MSB

HFC_VID_MSB OFFSET: 2865h RESET = 04h			HFC Vendor ID MSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_DID_MSB	R/W	Most Significant Byte of the HFC Product ID. This is a 16-bit value that identifies the vendor of the product (as registers with USB-IF).

TABLE 147: HFC DEVICE ID (BCDDEVICE) LSB

HFC_PID_MSB OFFSET: 2868h RESET = XXh			Hub Feature Controller Device ID LSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_DID_LSB	R/W	Least Significant Byte of the HFC Device ID. This is a 16-bit value that is used for firmware or device revision tracking purposes.

Note 1: The default Device ID may change with silicon or firmware revisions.

TABLE 148: HFC DEVICE ID (BCDDEVICE) MSB

HFC_PID_MSB OFFSET: 2869h RESET = XXh			Hub Feature Controller Device ID MSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	HFC_DID_MSB	R/W	Most Significant Byte of the HFC Product ID. This is a 16-bit value that is used for firmware or device revision tracking purposes.

Note 1: The default Device ID may change with silicon or firmware revisions.

TABLE 149: USB2.0 HFC MANUFACTURER STRING INDEX REGISTER

HFC_MFR_STR_INDEX OFFSET: 286Ah RESET = 03h			Hub Feature Controller Manufacturer String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	MFR_STR_INDEX	R/W	Manufacturer String Index Set = '00b' if unused

TABLE 150: USB2.0 HFC PRODUCT STRING INDEX REGISTER

HFC_PRD_STR_INDEX OFFSET: 286Bh RESET = 01h			Hub Feature Controller Product String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	PRD_STR_INDEX	R/W	Product String Index Set = '00b' if unused

TABLE 151: USB2.0 HFC SERIAL STRING INDEX REGISTER

HFC_SER_STR_INDEX OFFSET: 286Ch RESET = 02h			Hub Feature Controller Serial String Index Register Base Address: BF80_0000h
Bit	Name	R/W	Description
7:0	SER_STR_INDEX	R/W	Serial String Index Set = '00b' if unused

TABLE 152: HFC LANG_ID[15:0] LANGUAGE IDENTIFIER

HFC_LANG_ID OFFSET: 28FAh RESET = 0409h			HFC USB-IF Language Identifier Base Address: BFD2_0000h
Bit	Name	R/W	Description
15:0	LANG_ID	R/W	USB-IF Language Identifier. Default is English (United States).

Note 1: 28FAh-[7:0], 28FBh-[15:8]

TABLE 153: HFC PRODUCT STRING DESCRIPTOR CONTAINER

HFC_STR_CONTAINER OFFSET: 28FCh			USB2.0 HFC String Container Base Address: BFD2_0000h
Byte	Name	R/W	Description
95:0	Length	R/W	Container for All HFC Strings. This must follow the formatting as described in the <i>USB2.0 Specification</i> for string descriptors. All Hub Feature Controller product, manufacturer, and serial string are contained within this register array.

Note 1: 28FCh-[7:0], 28FDh-[15:8], 28FEh-[23:16], 28FFh-[31:24], 2900h-[39:32],... 295Bh-[95:88]

TABLE 154: USB2.0 HUB LANG_ID[15:0] LANGUAGE IDENTIFIER

USB2_HUB_LANG_ID OFFSET: 3202h RESET = 0409h			USB2.0 Hub USB-IF Language Identifier Base Address: BFD2_0000h
Bit	Name	R/W	Description
15:0	LANG_ID	R/W	USB-IF Language Identifier. Default is English (United States).

Note 1: 3202h-[7:0], 3203h-[15:8]

TABLE 155: USB2.0 HUB STRING DESCRIPTOR CONTAINER

USB2_HUB_STR_CONTAINER OFFSET: 3204h			USB2.0 Hub String Container Base Address: BFD2_0000h
Byte	Name	R/W	Description
95:0	Length	R/W	Container for All USB2.0 Hub Strings. This must follow the formatting as described in the <i>USB2.0 Specification</i> for string descriptors. All Hub Feature Controller Product, Manufacturer, and Serial string are contained within this register array.

Note 1: 3204h-[7:0], 3205h-[15:8], 3206h-[23:16], 3207h-[31:24], 3208h-[39:32],... 3263h-[95:88]

TABLE 156: RUNTIME FLAGS MEMORY

RUNTIME_FLAGS OFFSET: 3400h RESET = 0X00422228			Runtime Flags Base Address: BFD2_0000h
Bit	Name	R/W	Description
31:28	RESERVED	R	Reserved, do not modify
27	GEN_EXCEPTION_RESET	R/W	1 – If an exception occurs, reset the hub. 0 – If an exception occurs, code execution gets stuck in an infinite loop.
26	RESERVED	R	Reserved, do not modify
25	SS_MUX_FLIPPED	R/W	1 – Enable SS MUX flipped 0 – Disable SS MUX flipped ROM default value is 0.
24	RESERVED	R	Reserved, do not modify
23	DISABLE_CDP_MULTIPLE_HANDSHAKE	R/W	1 – Except the primary handshake in CDP mode, subsequent handshake by the downstream device while in CDP mode will be ignored by the firmware. 0 – Multiple handshakes by the downstream device while in CDP mode will be acknowledged by the firmware until a time period of BC_CDP_MULTIPLE_HANDSHAKE_TIMEOUT expires after the first handshake in CDP mode.
22	ENABLE_QUADSPI	R/W	0 – Quad SPI support is disabled in the firmware 1 – Quad SPI support is enabled in the firmware

TABLE 156: RUNTIME FLAGS MEMORY (CONTINUED)

RUNTIME_FLAGS OFFSET: 3400h RESET = 0X00422228			Runtime Flags Base Address: BFD2_0000h
Bit	Name	R/W	Description
21	DISABLE_I2CM_PULLUP_CHECK	R/W	0 – Presence of I ² C pull-up resistors will be checked prior to I ² C bridging and in any other operation involving the hub as I ² C master. 1 – Presence of I ² C pull-up resistors will not be checked prior to I ² C bridging and in any other operation involving the hub as I ² C master.
20	DISABLE_USB3HUB	R/W	Flag to disable USB3 hub 0 – USB3 hub is enabled 1 – USB3 hub is disabled Default ROM value is 0.
19	ENABLE_POWERSAVE	R/W	1 – The clock control bits mentioned below will be turned off by the firmware, when not required. 0 – The clock control bits mentioned below will not be turned off by the firmware, once turned on. UDC1_CLK_EN_DUR_SUSPEND UDC2_CLK_EN_DUR_SUSPEND
18:14	RESERVED	R	Reserved
13	ENABLE_CDP_TO_SDP_RECOVERY	R/W	1 – Toggle downstream VBUS when a downstream device does not enumerate in CDP mode. 0 – Do not toggle downstream VBUS when a downstream device does not enumerate in CDP mode. Note that, by default in ROM, the flag is 1 to ensure that downstream device enumeration is prioritized. This bit needs to be cleared to zero to run battery charging compliance tests using PET tester.
12	OTP_LOCK	R/W	When set, this is a soft lock of the OTP.
11	DISABLE_CDC_REMOTEWAKEUP_FEATURE	R/W	0 – CDC interface if enabled, reports as remote wakeup-capable. 1 – CDC interface is enabled, does not report as remote wakeup-capable.
10	DISABLE_125K_PU	R/W	0 – 125K pull-up resistors are enabled in China-mode battery charging. 1 – 125K pull-up resistors are disabled in China-mode battery charging.
9	ENABLE_BC_UNIVERSAL	R/W	0 – Disable BC 1.2-compliant changes to Universal BC algorithm 1 – Enable BC 1.2-compliant changes to Universal BC algorithm regardless of BC12_DCP bit in Runtime BC Flags (0x413X) If this is set to 1, then the HEARTBEAT_UNIT will be 5 ms. If this is set to 0, then the HEARTBEAT_UNIT will be 10 ms.

TABLE 156: RUNTIME FLAGS MEMORY (CONTINUED)

RUNTIME_FLAGS OFFSET: 3400h RESET = 0X00422228			Runtime Flags Base Address: BFD2_0000h
Bit	Name	R/W	Description
8	RESERVED	R	Reserved, do not modify
7	ENABLE_SPI_BYTE_FLASH	R/W	0 – Generic SPI Flash commands issued for SPI Flash programming 1 – Microchip Byte Flash commands issued for SPI Flash programming
6	BYPASS_MCU_SUSPEND	R/W	0 – Default UDC suspend handling 1 – MCU will not handle UDC suspend and will ignore the same. Note that if there is a suspend hook function present, that will still be invoked.
5	TARGET_OTP	R/W	Set target OTP 0 – Any command targeted to OTP (OTP read, OTP programming, and so on) is redirected to the pseudo OTP in SPI Flash physical address 0x40000 to 0x41FFF. 1 – Any command targeted to OTP (OTP read, OTP programming, and so on) is directed to the OTP.
4	CFG_FROM_SPI	R/W	Load config from SPI 1 – Configuration is loaded from pseudo OTP in SPI. 0 – Configuration will not be loaded from pseudo OTP in SPI.
3	CFG_FROM_OTP	R/W	Load config from OTP 1 – The firmware will load configuration from OTP. 0 – Configuration will not be loaded from OTP.
2	HUB_CFG_CLK	R/W	Enable Hubcfg interface power-down 1 – Clock-to-hub configuration registers are turned off after hub-attach to USB. 0 – Clock-to-hub configuration registers are left on.
1	UPDRESET_THROUGH_GPIO	R/W	Reserved, do not modify
0	DISABLE_BC	R/W	Disable battery charging 1 – Battery charging logic is completely disabled. 0 – Battery charging logic is left enabled based on other flags. ROM default is 0.

TABLE 157: RUNTIME FLAGS 2 MEMORY

RUNTIME_FLAGS2 OFFSET: 3408h RESET = 0X00			Runtime Flags 2 Base Address: BFD2_0000h
Bit	Name	R/W	Description
31:14	RESERVED	R	Reserved, do not modify
13	SPIPASSTHRU_RUN_FROM_ROM	R/W	Flag to enable SPI pass-through function running from SPI or ROM 0 – Running from SPI 1 – Running from ROM
12	PORTSPLIT_ENABLE_LTSSM_CHECK	R/W	Flag to disable LTSSM state machine 1 – LTSSM state check enabled 0 – LTSSM state check disabled ROM default value is 1.
11	I2CM_READ_MODE_INT	R/W	Flag to use Polling or Interrupt mode 1 – Interrupt mode 0 – Polling mode ROM default value is 1.
10	I2CM_WRITE_MODE_INT	R/W	Flag to use Polling or Interrupt mode 1 – Interrupt mode 0 – Polling mode ROM default value is 1.
9	BILLBOARD_ENABLE	R/W	Billboard Device functionality enable 0 – Billboard Device functionality disabled 1 – Billboard Device functionality enabled ROM default value is 0. See Section 7.0, Physical and Logical Port Mapping for more details.
8	DISABLE_UDC0_PORT	R/W	Flag to disable UDC0 port 0 – UDC0 port is enabled. 1 – UDC0 port is disabled. ROM default value is 0.
7	ENABLE_HIDBRIDGE	R/W	Flag to enable HID interface 0 – HID interface is disabled. 1 – HID interface is enabled. ROM default value is 0.
6:5	RESERVED	R	Reserved, do not modify
4	CDC_DISABLE	R/W	Flag to disable CDC interface when CDC configuration is selected through CFG_STRAP 0 – Not valid 1 – CDC interface is disabled in CDC mode ROM default value is 0.
3	I2S_DISABLE	R/W	Flag to disable I ² S interface when I ² S configuration is selected through CFG_STRAP 0 – Not valid 1 – I ² S interface is disabled in I ² S mode ROM default value is 0.
2	CONFIG_PORT_SPLIT	R/W	Flag to enable Port Split 0 – Port Split interface is disabled. 1 – Port Split interface is enabled. ROM default value is 0.

TABLE 157: RUNTIME FLAGS 2 MEMORY (CONTINUED)

RUNTIME_FLAGS2 OFFSET: 3408h RESET = 0X00			Runtime Flags 2 Base Address: BFD2_0000h
Bit	Name	R/W	Description
1	OTP_BASED_UDC_CONFIG	R/W	Flag to disable UDC configuration by ROM 0 – UDC port is configured by ROM. 1 – UDC port is configured by OTP/SMBus. ROM default value is 0.
0	HFC_DISABLE	R/W	Flag to disable the Hub Feature Controller (HFC) 0 – HFC is enabled. 1 – HFC is disabled. Default ROM value is 0.

TABLE 158: I2S FEATURE SELECT REGISTER

I2S_FEAT_SEL OFFSET: 3412h RESET = 03h			I ² S Feature Unit Select Register Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:3	Reserved	R	Reserved
7:0	I2S_UNIT_SEL	R/W	Control features of the I ² S interface if an I ² S configuration is selected. 00h – I ² S is disabled. 001h – Audio IN through microphone is enabled. 02h – Audio OUT is enabled. 03h – Both Audio IN are enabled. All other values are reserved.

TABLE 159: I2S HID FEATURE SELECT REGISTER

I2S_HFEAT_SEL OFFSET: 3413h RESET = 00h			I ² S HID Feature Select Register Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	I2S_HID_SEL	R/W	Control features of the HID Control of the I ² S interface if an I ² S configuration is selected. 00h – No I ² S HID control 01h – Reserved 02h – HID interface controls speaker mute 03h – HID interface controls speaker mute and microphone mute All other values are reserved.

TABLE 160: SMBUS OTP RESULT

SMBUS_OTP_RES OFFSET: 3419h RESET = 00h			SMBUS OTP Result Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:1	RESERVED	R	Always reads 0
0	RESULT	R	Result of the last OTP command received through SMBus 0 – Command completed successfully 1 – Command failed

TABLE 161: OTP UDC ENUMERATION

OTP_UDC_ENABLE OFFSET: 341Bh RESET = 00h			OTP UDC Enumeration Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	MODE	R/W	Controls UDC Enumeration. 00h – No change from default ROM behavior 01h – Enable UDC enumeration 02h – Disable UDC enumeration All other values are reserved.

TABLE 162: HUB PID MSB

HUB_DEF_PIDM OFFSET: 341Eh RESET = 00h			Primary Hub Default PID MSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	PRIH_PIDM	R/W	USB Primary Hub Default PID MSB. Reflects the SKU based on the bond and strap options, and could be different from the product PID.

TABLE 163: HUB PID LSB

HUB_DEF_PIDL OFFSET: 341Fh RESET = 00h			Primary Hub Default PID LSB Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	PRIH_PIDL	R/W	USB Primary Hub Default PID LSB. Reflects the SKU based on the bond and strap options, and could be different from the product PID.

TABLE 164: PORT 1 BATTERY CHARGING CONFIGURATION

BC_CONFIG_P1 OFFSET: 3433h RESET = 00h			Port 1 Battery Charging Configuration Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:6	UCS_LIM	R/W	When controlling UCS through I ² C, this sets the current limit. 00b – 500 mA 01b – 1000 mA 10b – 1500 mA 11b – 2000 mA
5	DCP	R/W	USB-IF Dedicated Charging Mode Enable. If bit 4 is set, this bit is ignored. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 0 – DCP disabled 1 – DCP enabled
4	CHINA_MODE	R/W	China mode. Enables a 125k pull-up to D+/D– while shorting D+/D– together to allow certain Chinese market phones to charge. 0 – China mode disabled 1 – China mode enabled
3	Reserved	R/W	Reserved
2:1	SE1_EN[1:0]	R/W	Enables SE1 charging mode for certain devices. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 00b – SE1 mode disabled 01b – SE1 1A mode enabled (D–: 2.7V, D+: 2.0V) 10b – SE1 2A mode enabled (D–: 2.0V, D+: 2.7V) 11b – SE1 2.5A mode enabled (D–: 2.7V, D+: 2.7V)
0	BC_EN	R/W	Battery Charging Support Enable. This bit enables CDP and must be set for any battery charging functions to be enabled. Other functions in addition to CDP are enabled by setting their respective bits in addition to this bit. 0 – Battery charging support disabled 1 – Battery charging support enabled

TABLE 165: PORT 2 BATTERY CHARGING CONFIGURATION

BC_CONFIG_P2 OFFSET: 3434h RESET = 00h			Port 2 Battery Charging Configuration Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:6	UCS_LIM	R/W	When controlling UCS through I ² C, this sets the current limit. 00b – 500 mA 01b – 1000 mA 10b – 1500 mA 11b – 2000 mA
5	DCP	R/W	USB-IF Dedicated Charging Mode Enable. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 0 – DCP disabled 1 – DCP enabled
4:3	CHINA_MODE	R/W	China mode. Enables a 125k pull-up to D+/D- while shorting D+/D- together to allow certain Chinese market phones to charge. 0 – China mode disabled 1 – China mode enabled
2:1	SE1_EN[1:0]	R/W	Enables SE1 charging mode for certain devices. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 00b – SE1 mode disabled 01b – SE1 1A mode enabled (D-: 2.7V, D+: 2.0V) 10b – SE1 2A mode enabled (D-: 2.0V, D+: 2.7V) 11b – SE1 2.5A mode enabled (D-: 2.7V, D+: 2.7V)
0	BC_EN	R/W	Battery Charging Support Enable. This bit enables CDP and must be set for any battery charging functions to be enabled. Other functions in addition to CDP are enabled by setting their respective bits in addition to this bit. 0 – Battery charging support disabled 1 – Battery charging support enabled

TABLE 166: PORT 3 BATTERY CHARGING CONFIGURATION

BC_CONFIG_P3 OFFSET: 3435h RESET = 00h			Port 3 Battery Charging Configuration Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:6	UCS_LIM	R/W	When controlling UCS through I ² C, this sets the current limit. 00b – 500 mA 01b – 1000 mA 10b – 1500 mA 11b – 2000 mA
5	DCP	R/W	USB-IF Dedicated Charging Mode Enable. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 0 – DCP disabled 1 – DCP enabled
4:3	CHINA_MODE	R/W	China mode. Enables a 125k pull-up to D+/D– while shorting D+/D– together to allow certain Chinese market phones to charge. 0 – China mode disabled 1 – China mode enabled
2:1	SE1_EN[1:0]	R/W	Enables SE1 charging mode for certain devices. This mode is only activated when a USB host is not present. When a host is present, the mode of operation is CDP. When SE1 mode and DCP mode are both enabled, the hub toggles between the two modes of operation as necessary to ensure the device can charge. 00b – SE1 mode disabled 01b – SE1 1A mode enabled (D–: 2.7V, D+: 2.0V) 10b – SE1 2A mode enabled (D–: 2.0V, D+: 2.7V) 11b – SE1 2.5A mode enabled (D–: 2.7V, D+: 2.7V)
0	BC_EN	R/W	Battery Charging Support Enable. This bit enables CDP and must be set for any battery charging functions to be enabled. Other functions in addition to CDP are enabled by setting their respective bits in addition to this bit. 0 – Battery charging support disabled 1 – Battery charging support enabled

Bit	Name	R/W	Description
7:0	Length	R/W	Manufacturer String Descriptor size. This must be the same as the value in the Length field of the Manufacturer String Descriptor .

TABLE 190: PRODUCT STRING LENGTH

PROD_STR_LEN OFFSET: 3472h RESET = 10h			Product String Length Base Address: BFD2_0000h
Bit	Name	R/W	Description
7:0	Length	R/W	Product String Descriptor size. This must be same as the value in the Length field of the Product String Descriptor .

4.0 SMBUS CONFIGURATION

The SMBus configuration begins in the SOC Configuration Stage. In this stage, the SOC may modify any of the configuration settings to customize the hub to their purposes. The SOC can configure the hub as Full-Speed only or can have the hub report a port as non-removable. The SOC can also disable a port entirely to conserve power. The hub can be addressed at the address **2Dh** and interprets the data bytes as shown in the following sub-sections.

4.1 SMBus Block Write

The SMBus block write consists of an Address+Direction(0) byte followed by the 16-bit memory address, split into two bytes. The address is used for special commands and as a pointer to the hub's internal memory. Following the address, the next byte of data corresponds to the count of data bytes that follows, which is up to 128 bytes in a block. Finally, a 00h write is used to terminate the write operation, followed by the SMBus stop signal. See [Table 191](#).

TABLE 191: SMBUS BLOCK WRITE

Field	Description
Start bit (S)	Start Condition
I2C Address	7-bit SMBus Address (2Dh)
Direction	1-bit, 0 = Write
ACK	Acknowledge from SMBus slave
Offset MSB	Most significant byte of address to internal buffer (00h)
ACK	Acknowledge from SMBus slave
Offset LSB	Least significant byte of address to internal buffer (00h)
ACK	Acknowledge from SMBus slave
Count	Start Condition
ACK	Acknowledge from SMBus slave
Data 0	First byte of data
ACK	Acknowledge from SMBus slave
Data 1	Second byte of data
ACK	Acknowledge from SMBus slave
Data n	Last byte of data
ACK	Acknowledge from SMBus slave
Stop (P)	Stop Condition

Note: The 7-bit address of the hub is **2Dh**, or the first byte is **5Ah** for an SMBus Write.

4.2 SMBus Block Read

The SMBus block read consists of an Address+Direction(0) byte with the 16-bit memory address, followed by a repeat Start signal and an Address+Direction(1) byte. The hub then starts to output the count (128 bytes) and the contents of the internal registers starting at the 16-bit address specified. See [Table 192](#).

TABLE 192: SMBUS BLOCK READ

Field	Description
Start bit (S)	Start Condition
I2C Address	7-bit SMBus Address (2Dh)
Direction	1-bit, 0 = Write
ACK	Acknowledge from SMBus slave
Offset MSB	Most Significant Byte of address to internal buffer (00h)
ACK	Acknowledge from SMBus slave
Offset LSB	Least Significant Byte of address to internal buffer (00h)
ACK	Acknowledge from SMBus slave
Start bit (Sr)	Repeated Start condition
I2C Address	7-bit SMBus Address (2Dh)
Direction	1-bit, 1 = Read
ACK	Acknowledge from SMBus slave
Count	Number of bytes to read from slave
ACK	Acknowledge from SMBus master
Data 0	First byte of data from SMBus slave
ACK	Acknowledge from SMBus master
Data 1	Second byte of data from SMBus slave
ACK	Acknowledge from SMBus master
Data n	Last data byte from SMBus slave
ACK	Acknowledge from SMBus master
Stop (P)	Stop condition

Note: The 7-bit address of the hub is **2Dh**, or the first byte is **5Ah** for a write and **5Bh** for a read.

4.3 Special Commands

Special commands can be sent in the place of the 16-bit address bytes. These commands are used to enumerate the hub, access the configuration registers, or reset the device. The commands consist of the 16-bit command followed by a 00h byte to terminate the command. See [Table 193](#).

TABLE 193: SPECIAL SMBUS COMMANDS

Operation	OPCODE	Description
Configuration Register Access	9937h	Read and Write Configuration Registers
USB Attach	AA55h	Exit SOC_CONFIG and Enter HUB_CONFIG stage
USB Attach with SMBus Runtime Access	AA56h	Exit SOC_CONFIG and Enter HUB_CONFIG stage with SMBus slave enabled
OTP Program	9933h	Permanently program configuration commands to the OTP
OTP Read	9934h	Read the values of the OTP register

Note: OTP Program and OTP Read commands reference data starting at configuration register 4800h.

4.4 Accessing Configuration Registers

The Configuration Register Access command allows the SMBus master to read or write to the internal registers of the hub. When the Configuration Register Access command is sent, the hub interprets the memory starting at offset 0000h as in [Table 194](#).

TABLE 194: MEMORY FORMAT FOR CONFIGURATION REGISTER ACCESS

Buffer Address	Description	Notes
0000h	Direction	0 = Register Write, 1 = Register Read
0001h	Data Length	Number of bytes to Read/Write, maximum of 128 bytes
0002h-0005h	Memory Address	32-bit memory address to read or write in big endian format
0006h~ 0084h	Data	Data to write or read from the Memory Address, number of bytes specified in the Data Length field

4.4.1 CONFIGURATION REGISTER WRITE EXAMPLE

To write to a configuration register:

1. Write the command block to the buffer area.
2. Execute the special Configuration Register Access command.

EXAMPLE 4-1: FORMATTING SMBUS MESSAGES TO SET HUB VID TO CUSTOM VALUE

The following example shows how the SMBus messages are formatted to set the VID of the hub to a custom value, 1234h:

1. Write the command block to the buffer area (See [Table 195](#)):

TABLE 195: SMBUS WRITE COMMAND BLOCK FOR REGISTER WRITE

Byte	Value	Comment
0	5Ah	Slave address plus write bit (2Dh left shifted by 1)
1	00h	Buffer address MSB 0000h
2	00h	Buffer address LSB 0000h
3	08h	Number of bytes to write to command block buffer area
4	00h	Write VID Register
5	02h	Writing two bytes to VID register
6	BFh	VID is in register BF80_3000h
7	80h	VID is in register BF80_3000h
8	30h	VID is in register BF80_3000h
8	00h	VID is in register BF80_3000h
A	34h	LSB of Vendor ID 1234h
B	12h	MSB of Vendor ID 1234h

2. Execute the Configuration Register Access command (See [Table 196](#)):

TABLE 196: CONFIGURATION REGISTER ACCESS COMMAND

Byte	Value	Comment
0	5Ah	Address plus write bit
1	99h	Command 9937h
2	37h	Command 9937h
3	00h	Command completion

4.4.2 CONFIGURATION REGISTER READ EXAMPLE

To read configuration registers:

1. Write the command block to the buffer area.
2. Execute the Configuration Register Access command.
3. Read the data from the memory.

EXAMPLE 4-2: READING THE PID

The example below shows how to read the PID.

1. Write the data to the memory of the hub (See [Table 197](#)):

TABLE 197: SMBUS WRITE COMMAND BLOCK FOR REGISTER READ

Byte	Value	Comment
0	5Ah	Slave address plus write bit (2Dh left shifted by 1)
1	00h	Memory address 0000h
2	00h	Memory address 0000h
3	06h	Number of bytes to write to memory
4	01h	Read Configuration Register
5	02h	Reading two bytes from PID register
6	BFh	VID is in register BF80_3002h
7	80h	VID is in register BF80_3002h
8	30h	VID is in register BF80_3002h
9	02h	VID is in register BF80_3002h

2. Execute the Configuration Register Access command (See [Table 198](#)):

TABLE 198: CONFIGURATION REGISTER ACCESS COMMAND

Byte	Value	Comment
0	5Ah	Address plus write bit (2Dh left shifted by 1)
1	99h	Command 9937h
2	37h	Command 9937h
3	00h	Command completion

3. Read back data starting at memory offset 04h, which is where the Data byte starts (See [Table 199](#)):

TABLE 199: EXAMPLE SMBUS READ COMMAND

Byte	Value	Comments
0	5Ah	Slave address plus write bit (2Dh left shifted by 1)
1	00h	Memory Address 0006h
2	06h	Memory Address 0006h
3	5Bh	Slave address plus read bit (2Dh left shifted by 1 + 1)
4	08h	Device sends a count of 8 bytes
5	16h	PID LSB
6	49h	PID MSB

Note 1: Although the device can send out 8 bytes, it is not necessary to read the 8 bytes. The SMBus Master can send a stop at any time.

4.5 SMBus Runtime

After the hub is enumerated (after USB Attach with SMBus Runtime Access), the same registers can be accessed during runtime.

5.0 OTP CONFIGURATION

The USB7202/USB7206/USB725x hubs have 8k bytes of one-time programmable (OTP) memory to enable customization and limited firmware updates in the field. OTP memory organization and OTP configuration are described in the next sections.

5.1 OTP Memory Organization

The OTP memory is divided into four regions as follows:

- OTP Flags
- Configuration Commands
- Blank Memory
- Configuration Index Records

Figure 2 shows the OTP memory organization example. Each product will have unique default contents.

FIGURE 2: OTP MEMORY ORGANIZATION

	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
0000h	OTP Flags															
0010h																
0020h																
0030h																
0040h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
0050h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
	00h	00h	00h	00h	00h											
...	00h	00h	00h	00h	00h											
1FC0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FD0h	00h	00h	00h	00h	00h	00h	00h									
1FE0h																
1FF0h																

5.1.1 OTP FLAGS

The first 2-4 bytes of the OTP memory are the OTP Flags indicating how many times the OTP has been programmed by the MPLAB Connect Configurator tool (when programming via SMBus, these bits are not updated). For an unprogrammed part, these two bytes are 0000h. Every time the OTP is programmed using MPLAB Connect Configurator, a bit is set. When the first OTP is programmed, this becomes 0001h, then 0003h, 0007h, and continues until all bits are set. After all OTP Flag bits are set, OTP programming is still possible as long as OTP space is available.

5.1.2 CONFIGURATION COMMANDS

The configuration commands section grows from the start of the OTP data. These are the commands that are appended every time a Program OTP command is sent through SMBus and can vary in length depending on how many configuration registers have been manipulated.

5.1.3 BLANK MEMORY

This memory region is initially 00h on an unprogrammed part and decreases in size as configuration commands and configuration index records are programmed.

5.1.4 CONFIGURATION INDEX RECORDS

The Configuration Index Records area contains Configuration Index Records that are automatically generated when the OTP data is programmed. A Configuration Index Record is always 8 bytes per OTP program and is appended to the back of the OTP memory space every time the Program OTP command is sent. It contains a checksum to confirm that the configuration command was written correctly as well as information on the location of the configuration commands within the OTP memory space and total length. The Configuration Index Record format is shown in Figure 3.

The CheckSum algorithm for the CheckSum byte is Checksum8-Xor.

FIGURE 3: CONFIGURATION INDEX RECORD FORMAT

BYTE	1	2	3	4	5	6	7	8
Description	Signature			Checksum	CFG ADDRESS		CFG LENGTH	
Contents	I (49h)	D (44h)	X (58h)	Checksum	MSB	LSB	MSB	LSB

5.2 OTP Configuration Using MPLAB Connect Configurator

The easiest method to program the USB7202/USB7206/USB725x Hub OTP is with the **MPLAB Connect Configurator** tool, available at: <http://www.microchip.com/design-centers/usb/mplab-connect-configurator>.

MPLAB Connect Configurator programs the configuration in the next available slot in the configuration commands area, programs the Index Record in the Configuration Index Records area, and updates the OTP Flags count field.

This tool can be used to generate a configuration file (.cfg) and to program the generated configuration file permanently to the hub's OTP memory space using USB commands.

Alternatively, the .cfg file can be constructed manually using a binary/hex editor. Follow the formatting instructions shown in [Table 200](#), and see the example in [Section 5.3.1, OTP Configuration File Examples](#).

5.3 OTP Configuration Using SMBus

The OTP memory can be programmed through the SMBus interface in the SOC_CONFIG stage (during start-up). The OTP memory is configured as a series of commands that manipulates the configuration registers. The USB7202/USB7206/USB725x hubs have a total of 8 kB of OTP memory space, and each byte of OTP memory may be written only once. The OTP memory space can be successively written to (each programming instance appends the new command to the bottom of the OTP memory space) until the space is completely filled.

During the HUB_CONFIG stage, temporary OTP configuration registers are written to. The contents in the OTP configuration registers are then permanently loaded to the OTP memory space after sending a special OTP program command. These registers permanently change the default behavior of the hub during normal operation. These commands are stored into the OTP memory as shown in [Figure 2](#).

TABLE 200: OTP STORAGE COMMANDS

Command	OPCODE	Length	Description
NULL	00h	N/A	No action; advance memory counter by 1 and move to the next instruction.
MODIFY_BYTES	01h-7Fh	OPCODE	<p>Modifies the following bytes starting at the current memory address for length = OPCODE.</p> <p>The previously used SET_MODE command is used for selecting the bit operation.</p> <p>The default MODE is WRITE_BYTES if there is no preceding SET_MODE command.</p>
SET_MEMORY_ADDRESS	80h XXh XXh XXh XXh	N/A	<p>Load the MEMORY_ADDRESS register with the four XXh XXh XXh XXh bytes.</p> <p>Example: 80h BFh 80h 30h 00h sets the memory address to BF80_3000h.</p>
SKIP_MEMORY_WRITE	81h-FDh	OPCODE [6:0]	Skip the length number of bytes starting at the location of the MEMORY_ADDRESS register. At the end of the operation, the MEMORY_ADDRESS register is incremented by length = OPCODE[6:0].
SET_MODE_WRITE_BYTE	FEh 00	N/A	If the byte following SET_MODE = 00h, all writes replace the memory value at that location.
SET_MODE_SET_BITS	FEh 01h	N/A	If the byte following SET_MODE = 01h, all writes are OR'ed in. This is a mechanism to set the selected bits in a register without changing the others. Set the bits to be set.
SET_MODE_CLEAR_BITS	FEh 02h	N/A	If the byte following SET_MODE = 02h, all writes are NAND'ed in. This is a mechanism to clear the selected bits in a register without changing the others. Set the bits to be cleared.
STOP	FFh	N/A	After the storage commands are complete, this indicates the termination of the command sequence.

5.3.1 OTP CONFIGURATION FILE EXAMPLES

[Example 5-1](#) and [Example 5-2](#) show the hex data in a configuration file.

EXAMPLE 5-1: CONFIGURING PF28 AS AN OUTPUT GPIO

To configure PF28 as an output assuming that PF28 is already configured as a GPIO (as it is in USB7202, all CFG_STRAP options), the corresponding bit in the output enable register must be set, which from [Table 4](#) is GPIO92.

TABLE 201: SET BIT COMMAND SEQUENCE EXAMPLE

Byte	Value	Comment
1	80h	SET_ADDRESS command
2	BFh	Address BF 80_090Bh
3	80h	Address BF 80 _090Bh
4	09h	Address BF80_ 09 0Bh
5	01h	Address BF80_090 B h
6	FEh	SET_MODE command
7	01h	SET_BITS mode
8	01h	Data length of 1 byte
9	04h	Set PIO96_OEN[Bit 28]
10	FFh	Stop command

EXAMPLE 5-2: CHANGING THE USB DOWNSTREAM PORT 1 BOOST REGISTER TO INCREASE THE HS OUTPUT CURRENT BY 5%

TABLE 202: WRITE BYTE COMMAND SEQUENCE EXAMPLE

Byte	Value	Comment
1	80h	SET_ADDRESS command
2	BFh	Address BF 80_64CAh
3	80h	Address BF 80 _64CAh
4	64h	Address BF80_ 64 CAh
5	CAh	Address BF80_64 CA h
6	FEh	SET_MODE command
7	01h	WRITE_BYTE mode
8	01h	Data length of 1 byte
9	03h	Increase HS output current by 5%
10	FFh	Stop command

5.3.2 OTP CONFIGURATION VIA SMBUS

The commands in [Table 203](#) can be used to access and program the OTP memory. These can be used by an automated test equipment (ATE) equipment.

TABLE 203: SPECIAL OTP SMBUS COMMANDS

Operation	OPCODE	Description
SMB_CMD_OTP	9933h	Execute OTP Command based on CMD_TYPE
SMB_CMD_READ_OTP	9934h	Read OTP register
SMB_CMD_OTP_ATE	9939h	Execute OTP Command based on CMD_TYPE. This command is for use with ATE. Command success or failure is reported via signal pins. The device does not respond afterwards until reset. <ul style="list-style-type: none"> Command status pin: PRT_PWR1 (0 = Passed, 1 = OTP Failed) Command completion pin: PRT_PWR2 (0 = In progress, 1 = done)

Note 1: Before any OTP commands can be executed, a data structure must be created in the memory using SMBus block writes.

5.3.3 SMBUS OTP COMMAND STRUCTURE

The OTP command structure in [Table 204](#) is used for accessing the OTP memory.

TABLE 204: SMBUS OTP COMMAND STRUCTURE

Buffer Address	Description	Notes
BFD2_2100h	CMD_TYPE	Command Type is one of the commands in the OTP Command Type table.
BFD2_2101h	ADDR[15:0]	OTP Address to read from or write to; set to 0000h.
BFD2_2103h	LENGTH[15:0]	Number of bytes to transfer
BF90_7000h	Data	Data for OTP transaction. MULTI_HOST_CLK_EN and MHB_MEM_CLK_EN bits must be set before accessing the DATA_BUFFER.
BFD2_3419h	SMBusOTPResult	Result of OTP operation as specified in the OTP Return Status

TABLE 205: OTP COMMAND TYPE

Code	CMD_TYPE	Description
00h	SMB_OTP_RAW_PGM	Raw OTP Programming mode *ADVANCED* OTP will be programmed starting at the OTP memory offset of ADDR for size LENGTH. The OTP memory at any location with the OTP can be programmed. No signature is generated. It is possible to corrupt existing configuration using this mode. A new OTP configuration block programmed using this mode will also need a valid signature to be manually added to the correct signature memory location. Status on completion: <ul style="list-style-type: none"> 00h = OTP was programmed and verified successfully. 01h = OTP programming failed.

TABLE 205: OTP COMMAND TYPE (CONTINUED)

Code	CMD_TYPE	Description
03h	SMB_OTP_PGM	<p>“Smart” OTP Programming mode</p> <p>This programs the OTP configuration block automatically after the last programmed OTP record.</p> <p>The hub will automatically generate and program the signature at the end of the OTP memory space in the next available memory space including the IDX signature, record checksum, start offset, and length.</p> <p>The LENGTH and DATA buffer must be initialized before issuing this command.</p> <p>Status on completion:</p> <ul style="list-style-type: none"> • 00h = OTP was programmed and verified successfully. • 01h = OTP programming failed.
05h	SMB_OTP_BLANKCHECK	<p>This verifies that the OTP is blank and has not been programmed.</p> <p>Status on completion:</p> <ul style="list-style-type: none"> • 00h = PASS; OTP is blank and has not been programmed. • 01h = FAIL; OTP blank check failed.
06h	SMB_OTP_RESET	<p>This resets the OTP core.</p> <p>Status on completion:</p> <ul style="list-style-type: none"> • 00h = OTP_NO_ERROR
07h	SMB_OTP_READ	<p>This command reads the number of bytes specified in the LENGTH field and stores them in data buffer.</p> <p>Status on completion:</p> <ul style="list-style-type: none"> • 00h = OTP data was read successfully. • 01h = OTP read failed.

5.3.4 STEPS FOR PROGRAMMING OTP USING SMBUS

1. Write the OTP memory structure.
2. Send the Execute OTP command.
3. Read SMBusOTPRResult.

EXAMPLE 5-3: SMBUS OTP “SMART” PROGRAMMING

The "Smart" OTP programming method allows users to program an OTP configuration block without the calculation of OTP memory offset and manual generation/programming of configuration index signature. In "Smart" OTP Programming mode, the hub automatically places the Configuration data into the next available memory space, and generates/programs the correct Configuration Index signature.

This example changes the PID LSB at BF803002h to 34h, and the PID MSB at BF803003h to 12h.

The OTP configuration data for this is 80 BF 80 30 02 02 34 12 FF.

Write OTP Memory Structure

1. Write 86, C7, 01, E0 to BF80_0B00h: 00 00 0A 00 04 BF 80 0B 00 86 C8 00 E0
2. Write SMBus Configuration Register Access command: 5A 99 37 00
3. Resume HFC Operation: 00 00 07 00 01 BF 80 2C 02 C2
4. Write SMBus Configuration Register Access command: 5A 99 37 00
5. Write OTP Patch to Data Area at BF90_7000h: 5A 00 00 0F 00 09 BF 90 70 00 80 BF 80 30 02 02 34 12 FF
6. Write SMBus Configuration Register Access command: 5A 99 37 00
7. Write OTP "03" to BFD2_2100 to indicate "Smart OTP" programming to program to next available OTP space: 00 00 07 00 01 BF D2 21 00 03
8. Write SMBus Configuration Register Access command: 5A 99 37 00
9. Write OTP patch length (09h) to BFD2_2103h: 00 00 08 00 02 BF D2 21 03 00 09
10. Write SMBus Configuration Register Access command: 5A 99 37 00

Send the Execute OTP Command

11. Write to SMBus: 5A 99 33 00

Read SMBus OTP Result Register

12. Set the command block for status read at BFD2_3419h: 5A 00 00 06 01 01 BF D2 34 19
13. Write SMBus Configuration Register Access command: 5A 99 37 00
14. Read Data: 5A 00 06 5B 08 XX

Note: XX is the status returned: 00 = Pass.

EXAMPLE 5-4: SMBUS OTP “RAW” PROGRAMMING (ADVANCED)

The Raw OTP Programming method allows any byte or block of bytes to be programmed within the hub OTP memory. Generally, when programming typical configuration memory blocks, the standard OTP programming method should be used.

The Raw OTP Programming feature can be used to intentionally corrupt a previously programmed configuration block's CheckSum byte in the Configuration Index signature. Doing this prevents the configuration block from being loaded. This technique can be used to recover a hub that was rendered non-functional by an incorrectly formatted configuration data block.

For example, if the CheckSum byte of the configuration block that needs to be prevented from being loaded is located at memory offset 1FEBh (meaning, it was the third configuration block to be programmed into the hub's OTP memory), then the following commands can be followed to overwrite that byte with an FFh to intentionally corrupt that byte.

Write OTP Memory Structure

1. Write 86, C7, 01, E0 to BF80_0B00h: 00 00 0A 00 04 BF 80 0B 00 86 C8 00 E0
2. Write SMBus Configuration Register Access command: 5A 99 37 00
3. Resume HFC Operation: 00 00 07 00 01 BF 80 2C 02 C2
4. Write SMBus Configuration Register Access command: 5A 99 37 00
5. Write OTP Patch to Data Area at BF90_7000h: 5A 00 00 07 00 01 BF 90 70 00 FF
6. Write SMBus Configuration Register Access command: 5A 99 37 00
7. Write OTP “00” to BFD2_2100 to indicate “Smart OTP” programming to program to next available OTP space: 00 00 07 00 01 BF D2 21 00 00
8. Write SMBus Configuration Register Access command: 5A 99 37 00
9. Write OTP patch memory offset (1FEBh) to BFD2_2101h to overwrite the data payload (FFh) to the third Configuration Index signature location: 00 00 08 00 02 BF D2 21 01 1F FE
10. Write SMBus Configuration Register Access command: 5A 99 37 00
11. Write OTP patch length (01h) to BFD2_2103h: 00 00 08 00 02 BF D2 21 03 00 01
12. Write SMBus Configuration Register Access command: 5A 99 37 00

Send the Execute OTP Command

13. Write to SMBus: 5A 99 33 00

Read SMBus OTP Result Register

14. Set the command block for status read at BFD2_3419h: 5A 00 00 06 01 01 BF D2 34 19
15. Write SMBus Configuration Register Access command: 5A 99 37 00
16. Read data: 5A 00 06 5B 08 XX

EXAMPLE 5-5: SMBUS OTP READ

The OTP memory of the hub can be read via SMBus in its entirety or in selected chunks.

The following example shows how to read back the entire OTP memory.

General Setup

1. Set up CLK_CTL_REG BF80_0B00h: 5A 00 00 0A 00 04 BF 80 0B 00 86 C8 00 E0
2. Write SMBus Configuration Register Access command: 5A 99 37 00
3. Start-up HFC Execution, Length at BF80_2CC2h: 5A 00 00 07 00 01 BF 80 2C 02 C2
4. Write SMBus Configuration Register Access command: 5A 99 37 00

Configure for read-back of first 4 kB of OTP Memory Space

5. Configure to take the first 4 kB of OTP memory and dump to BF90_7000h space: 5A 00 00 0B 00 05 BF D2 21 00 07 00 00 10 00
6. Write SMBus Configuration Register Access command: 5A 99 37 00

Send the Execute OTP Command

7. Write to SMBus: 5A 99 33 00

Read SMBus OTP Result Register

8. Set the command block for status read at BFD2_3419h: 5A 00 00 06 01 08 BF D2 34 19
9. Write SMBus Configuration Register Access command: 5A 99 37 00
10. Read data: 5A 00 06 5B 06 XX

Note: XX is the status returned: 00 = Pass.

Read Back first 4 kB of OTP Memory

11. Set the command block for read-back of first 128 kB chunk of OTP starting from BF90_7000h: 5A 00 00 06 01 80 BF 90 70 00
12. Write SMBus Configuration Register Access command: 5A 99 37 00
13. Read data: 5A 00 06 5B 06 XX₀ - XX₁₂₇

Note: XX₀ - XX₁₂₇ is returned 128 kB of OTP memory

14. Set the command block for read-back next 128 kB chunk of OTP starting from BF90_7080h: 5A 00 00 06 01 80 BF 90 70 80
15. Write SMBus Configuration Register Access command: 5A 99 37 00
16. Read data: 5A 00 06 5B 06 XX₁₂₈ - XX₂₅₅

XX₁₂₈ - XX₂₅₅ is returned 128 kB of OTP memory

17. Set the command block for read-back next 128 kB chunk of OTP starting from BF90_7100h: 5A 00 00 06 01 80 BF 90 71 00
18. Write SMBus Configuration Register Access command: 5A 99 37 00
19. Read data: 5A 00 06 5B 06 XX₂₅₆ - XX₃₈₃

XX₂₅₆ - XX₃₈₃ is returned 128 kB of OTP memory

20. Continue until the first 4 kB of OTP memory is retrieved.

Configure for read-back of second 4 kB of OTP memory space

21. Configure to take the second 4 kB of OTP memory and dump to BF90_7000h space: 5A 00 00 0B 00 05 BF D2 21 00 07 10 00 10 00
22. Write SMBus Configuration Register Access command: 5A 99 37 00

Send the Execute OTP Command

23. Write to SMBus: 5A 99 33 00

Read Back second 4 kB of OTP Memory

24. Set the command block for read-back next 128 kB chunk of OTP starting from BF90_7100h: 5A 00 00 06 01 80 BF 90 70 00
25. Write SMBus Configuration Register Access command: 5A 99 37 00
26. Read data: 5A 00 06 5B 06 XX_{4,096} - XX_{4,223}
XX_{4,096} - XX_{4,223} is returned 128 kB of OTP memory
27. Continue until the second 4 kB of OTP memory is retrieved.

5.4 OTP Configuration via USB

The following are the steps to configure OTP via USB:

1. Read OTP Setup Transaction
2. Set OTP Program Code
3. Program OTP Transaction to Program OTP Configuration Data to OTP
4. Get Status OTP Transaction

5.4.1 READ OTP SETUP TRANSACTION

To program OTP via USB, the entire OTP memory contents must be read to obtain the correct memory offset location for the OTP configuration block and the signature. Refer to the [Section 5.1, OTP Memory Organization](#) for the OTP memory organization.

The new configuration block should be programmed to the next byte following the end of the most recently programmed configuration block (configuration command blocks work forward from the beginning of the OTP memory space). The new Configuration Index signature should begin 8 bytes before the start of the most recently programmed Configuration Index signature (signatures are added backwards from the end of the memory space).

Note: Two to four bytes at the very beginning of the OTP memory are left intentionally blank at the time of production. The MPLAB Connect Configurator tool uses these bytes to keep track of the number of times the tool has been used to update the OTP memory. When programming OTP via USB manually, these bits may be optionally used to keep track of the number of additional times the hub OTP memory has been programmed. The hub FW does not actually use these bytes for any purpose.

Issue the command in [Table 206](#) to read the OTP memory.

TABLE 206: OTP READ SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0xC1	Device-to-host to data transfer, using vendor-specific command, targeting interface
bRequest	0x01	CMD_OTP_READ
wValue	OTP_ADRESS	Address of the OTP ROM to be read
wIndex	0x00	Reserved
wLength	Data Length	Length of data to be read

Note 1: Command phase: Receives the SETUP packet with the parameters specified above.

Data phase: Sends the data bytes of length wLength from address wValue.

Status phase:

- STALL – on read error
- ACK – on successful completion of command

5.4.2 SET OTP PROGRAM CODE

The OTP memory can be programmed by either the PROGRAM command or the PROGRAMVERIFY command. CMD_OTP_SET_PROGRAM_MODE selects the internal command that the ROM will issue to the OTP during subsequent CMD_OTP_PROGRAM commands. (See [Table 207](#) and [Table 208](#).)

The default mode in the ROM is PROGRAMVERIFY (without requiring the Set OTP Program Mode command to be issued always).

TABLE 207: SET OTP PROGRAM MODE SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0x41	Host-to-device to data transfer, using vendor-specific command, targeting interface
bRequest	0xF1	CMD_OTP_SET_PROGRAM_MODE
wValue	Programming Option	Indicates if the future CMD_OTP_PROGRAM commands will issue the PROGRAMVERIFY or PROGRAM command <ul style="list-style-type: none">• 0x01 – PGMVFY• 0x02 – PROGRAM
wIndex	0x0000	Reserved
wLength	Data Length	No Data Command

Note 1: **Command phase:** Receives the SETUP packet as specified in the table.

Status phase:

- ACK – On successful completion of the command

5.4.3 PROGRAM OTP TRANSACTION TO PROGRAM OTP CONFIGURATION DATA TO OTP

Method 1: Program the entire 8 kB in a single step.

This method allows the OTP to be updated with a signal program command, but requires transferring 8 kB to the hub before sending the program command.

To simplify the update process, it is recommended to first read back the entire 8 kB OTP memory space, insert the new Configuration data block and index signature to the read back file, and transfer the entire amended 8 kB back to the hub. Overwriting previously written to bytes with the same redundant data is supported and will have no negative effect.

With this method, OTP_ADDRESS is always 0x000, and wLength is always 0x1FFF.

Method 2: Program only the new configuration data block and signature index in two separate programming steps.

This method allows the hub OTP to be updated with the minimum amount of data transfer possible, but requires two separate program commands to achieve.

An alternate method is to perform an OTP memory dump, locate the offset of the configuration data block, and program only the new configuration block to the proper memory offset. Then, in a separate programming step, add the new configuration index signature to the correct memory offset.

An optional read-back step can be performed to ensure the data is correctly stored.

TABLE 208: OTP PROGRAM SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0x41	Host-to-device data transfer, using vendor-specific command, targeting interface
bRequest	0x00	CMD_OTP_PROGRAM
wValue	OTP_ADDRESS	Address of the OTP memory for the Configuration Data block to be written
wIndex	0x00	Reserved
wLength	Data Length	Length of data to be written

Note 1: **Command phase:** Receives the SETUP packet with the parameters specified above.

Data phase: Receives the data bytes of length wLength and programs the OTP accordingly.

Status phase:

- STALL – on programming error
- ACK – on successful completion of programming

Use CMD_OTP_GET_STATUS to get the status for more information on the failure.

Note: Programming OTP via USB requires that a valid signature at the end of OTP is also manually generated and programmed to the correct memory location. There is no automated signature generation option when programming OTP via USB. For a configuration block to be loaded by the hub FW, steps 5 and 6 must also be followed correctly.

5.4.4 GET STATUS OTP TRANSACTION

To ensure the previous Configuration block was programmed to OTP successfully, issue the command in [Table 209](#) to get the OTP status.

TABLE 209: OTP GET STATUS SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0xC1	Device-to-host to data transfer, using vendor-specific command, targeting interface
bRequest	0x02	CMD_OTP_GET_STATUS
wValue	0x0000	Address of the OTP ROM to be read
wIndex	0x0000	Reserved
wLength	0x01	One byte status to be returned

Note 1: **Command phase:** Receives the SETUP packet with the parameters specified above.

Data phase: Sends the status byte.

Status phase:

- STALL – on read error
- ACK – on successful completion of command

The status code returned is shown in [Table 210](#).

TABLE 210: OTP STATUS CODES

Status Code	Description
0x00	Command successful completion
0x01	Generic error

EXAMPLE 5-6: OTP PROGRAMMING EXAMPLE

An OTP patch is generated to change the value of register 0xBF80_3000 = 0x34 and 0xBF80_3001 = 0x12, such that the VID is changed to 0x1234.

The OTP contents for this patch would be:

80 BF 80 30 00 FE 00 02 34 12 FF

Step 1: An OTP memory read-back is performed, and the following data is returned (See [Figure 4](#)):

FIGURE 4: EXAMPLE RETURNED OTP READ

	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
0000h	OTP Flags															
0010h	OTP Flags	80	BF	CF	80	8E	10	00	00	00	00	00	00	00	00	0B
0020h	12	1A	04	03	01	02	80	BF	D2	2E	1A	10	00	00	00	00
0030h	00	00	00	0B	24	0B	12	1A	04	03	01	02	FFh	00h	00h	00h
0040h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
0050h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
...	00h	00h	00h	00h	00h	Blank Memory							00h	00h	00h	00h
1FC0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FD0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FE0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FF0h	00h	00h	00h	00h	00h	00h	00h	00h	49h	44h	58h	D8h	00h	12h	00h	2Dh

Step 2: The Configuration Data should be placed as shown in yellow in [Figure 5](#) at memory offset 003Dh – 0047h.

The Configuration Index signature should be placed in the next available signature location as shown in yellow in [Figure 5](#) at memory offset 1FF0h – 1FF7h.

FIGURE 5: OTP MEMORY WITH NEW CONFIGURATION DATA INSERTED

	0h	1h	2h	3h	4h	5h	6h	7h	8h	9h	Ah	Bh	Ch	Dh	Eh	Fh
0000h	OTP Flags															
0010h	OTP Flags	80	BF	CF	80	8E	10	00	00	00	00	00	00	00	00	0B
0020h	12	1A	04	03	01	02	80	BF	D2	2E	1A	10	00	00	00	00
0030h	00	00	00	0B	24	0B	12	1A	04	03	01	02	FFh	80h	BFh	80h
0040h	30h	00h	Feh	00h	02h	34h	12h	FFh	00h	00h	00h	00h	00h	00h	00h	00h
0050h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
...	00h	00h	00h	00h	00h	Blank Memory							00h	00h	00h	00h
1FC0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FD0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FE0h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h	00h
1FF0h	49h	44h	58h	AAh	00h	3Dh	00h	0Bh	49h	44h	58h	D8h	00h	12h	00h	2Dh

The signature data is generated based upon the data contents, a checksum, the location that it is placed within the OTP memory, and the length. Hence, the signature for this example is shown in [Figure 6](#).

FIGURE 6: EXAMPLE CONFIGURATION INDEX

BYTE	1	2	3	4	5	6	7	8
Description	Signature			Checksum	CFG ADDRESS		CFG LENGTH	
Contents	I (49h)	D (44h)	X (58h)	AAh	00h	3Dh	00h	0Bh

Step 3: Send the CMD_OTP_PROGRAM command with the 8 kB of amended OTP data as the data payload for the USB transaction.

Step 4: Verify that programming was successful by sending CMD_OTP_GET_STATUS and verifying that the returned payload is 0x00.

Step 5: Perform another OTP memory read to confirm programming was successful.

5.5 Memory Access during Runtime via USB

The hub memory mapped registers can be accessed during runtime via USB. See [Table 211](#) and [Table 212](#).

Note: Not all registers should be modified during runtime as this could affect normal operation.

TABLE 211: MEMORY WRITE SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0x40	Host-to-device data transfer, vendor class, targeted to interface
bRequest	0x03	CMD_MEMORY_WRITE
wValue	ADDR_LO	Lower 16 bits of the Target Memory Address in little-endian format
wIndex	ADDR_HI	Upper 16 bits of the Target Memory Address in little-endian format
wLength	Data Length	Length of data to be written

Note 1: Command phase: Receives the SETUP packet with the parameters specified above.

Data phase: Receives the data bytes of length wLength and writes data starting at the target memory address.

Status phase:

- ACK – on successful completion of memory write

TABLE 212: MEMORY READ SETUP PACKET

SETUP Packet	Value	Description
bmRequestType	0xC0	Device-to-host data transfer, vendor class, targeted to interface
bRequest	0x04	CMD_MEMORY_READ
wValue	ADDR_LO	Lower 16 bits of the Target Memory Address in little-endian format
wIndex	ADDR_HI	Upper 16 bits of the Target Memory Address in little-endian format
wLength	Data Length	Length of data to read

Note 1: Command phase: Receives the SETUP packet with the parameters specified above.

Data phase: Sends the data bytes of length wLength starting from the target memory address.

Status phase:

- ACK – on successful completion of programming

EXAMPLE 5-7: USB MEMORY WRITE

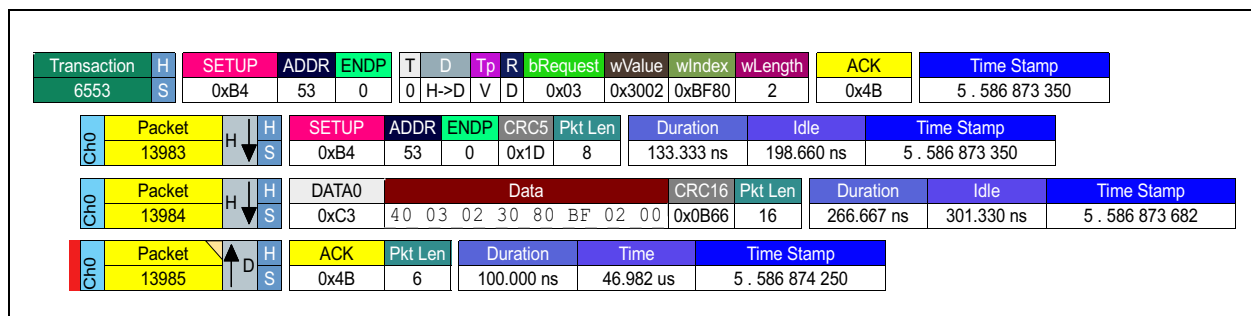

This example changes the PID at location BF80_3002h.

1. **Memory Write SETUP Phase Transaction:** The USB host sends the SETUP packet to the Hub Feature Controller at Endpoint 0. See [Table 213](#) and [Figure 7](#).

TABLE 213: MEMORY WRITE SETUP PACKET

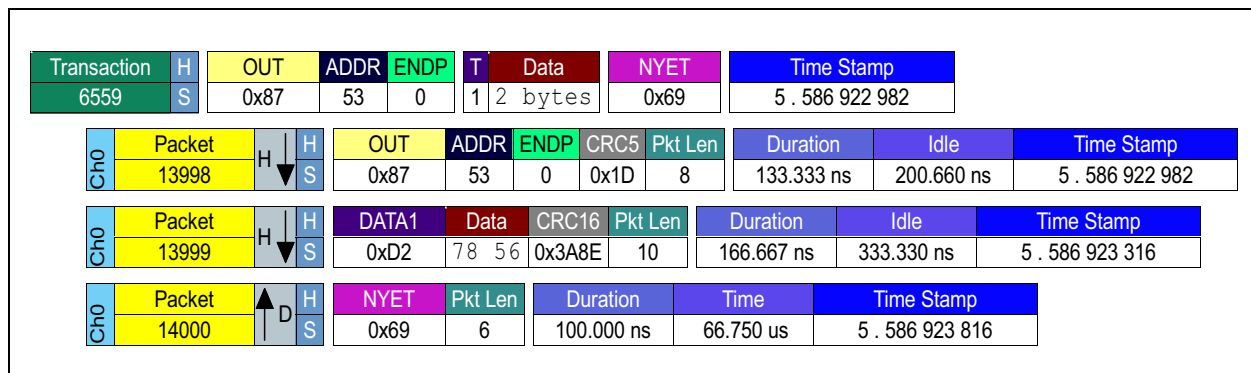

SETUP Packet	Value	Description
bmRequestType	0x40	Host-to-device data transfer, vendor class
bRequest	0x03	CMD_MEMORY_WRITE
wValue	0x3002	Lower 16 bits of the Target Memory Address in little-endian format
wIndex	0xBF80	Upper 16 bits of the Target Memory Address in little-endian format
wLength	0x0002	Length of data to be written

FIGURE 7: MEMORY WRITE SETUP TRANSACTION

2. **Memory Write Data Phase OUT Transaction:** The USB host sends two data bytes to set BF803002 = 5678h. See [Figure 8](#).

FIGURE 8: MEMORY WRITE OUT TRANSACTION

3. **Memory Write Status Phase IN Transaction:** The USB host sends an IN packet to complete the transfer. The Hub Feature Controller responds with a zero length data packet. See [Table 213](#) and [Figure 9](#).

FIGURE 9: MEMORY WRITE IN TRANSACTION

Transaction	H	IN	ADDR	ENDP	T	Data	ACK	Time Stamp

6.0 HUB PRODUCT IDS

6.1 Hub Feature Controller (UDC0)

The Hub Feature Controller (UDC0) is enabled by default, thus reported as a non-removable device.

The Hub Feature Controller exposes different USB interfaces depending on the state of the configuration straps (CONFIG_STRAPx pins), enabling the features relevant to the selected PFX pins. Exposing a different PID for different configurations is required so that the correct USB client drivers are loaded.

The base PID is maintained as 0x7240. However, the last nibble is maintained to reflect the enabled features as shown in [Table 215](#), with bit 0 indicating the presence of I²S HID, bit 1 indicating the presence of I²S Audio, bit 2 indicating the presence of CDC, and bit 3 indicating the presence of Generic USB Device (WinUSB on Windows).

TABLE 215: HUB FUNCTION CONTROLLER (UDC0) PIDS

WinUSB	CDC	I ² S Audio	I ² S HID	UDC0 Device Configuration	PID
No	No	No	No	No interface present; will not enumerate	NA
No	No	No	Yes	Invalid	NA
No	No	Yes	No	I ² S Audio	7242h
No	No	Yes	Yes	I ² S Audio, I ² S HID	7243h
No	Yes	No	No	CDC Data, CDC Control	7244h
No	Yes	No	Yes	Invalid	NA
No	Yes	Yes	No	CDC Data, CDC Control, I ² S Audio	7246h
No	Yes	Yes	Yes	CDC Data, CDC Control, I ² S Audio, I ² S HID	7247h
Yes	No	No	No	Generic USB Device (WinUSB on Windows)	7240h
Yes	No	No	Yes	Invalid	NA
Yes	No	Yes	No	Generic USB Device (WinUSB on Windows)	724Ah
Yes	No	Yes	Yes	Generic USB Device (WinUSB on Windows), I ² S Audio, I ² S HID	724Bh
Yes	Yes	No	No	Generic USB Device (WinUSB on Windows), CDC Data, CDC Control	724Ch
Yes	Yes	No	Yes	Invalid	NA
Yes	Yes	Yes	No	Generic USB Device (WinUSB on Windows), CDC Data, CDC Control, I ² S Audio	724Eh
Yes	Yes	Yes	Yes	Generic USB Device (WinUSB on Windows), CDC Data, CDC Control, I ² S Audio, I ² S HID	724Fh

6.2 Hub PID Selection

[Table 216](#) shows the Primary Hub, Secondary Hub, UDC1, and UDC2 PIDs based on part number.

TABLE 216: PID SELECTION OPTIONS

Device	Package	USB2 HUB PID	USB3 HUB PID	Multi-Host Endpoint Reflector UDC1 PID (Upstream Port Side)	Multi-Host Endpoint Reflector UDC2 PID (Downstream Port Side)
USB7202	QFN100	4202h ¹	7202h ¹	7210h	7220h
USB7206	QFN100	4206h ¹	7206h ¹	7210h	7220h

USB7256	QFN100	4256h ¹	7256h ¹	7210h	7220h

7.0 PHYSICAL AND LOGICAL PORT MAPPING

USB7202/USB7206/USB7251/US7252/USB7256 family of devices are based upon a common architecture, but all have different modifications and/or pin bond outs to achieve the various device configurations.

The base chip is composed of a total of 6 USB3 PHYs and 7 USB2 PHYs. These PHYs are physically arranged on the chip in a certain way, which is what is referred to as the PHYSICAL port mapping.

The actual port numbering may be remapped by default in different ways on each product. This changes the way that the ports are numbered from the USB host's perspective. This is referred to as LOGICAL mapping.

The various configuration options available for these devices may, at times, be with respect to PHYSICAL mapping or LOGICAL mapping. Each individual configuration option which has a PHYSICAL or LOGICAL dependency is declared as such within the register description.

The PHYSICAL vs. LOGICAL mapping is described within each device's respective data sheet, and is also abbreviated from [Table 217](#) to [Table 220](#).

Note: The device datasheets also include visual aids for describing the LOGICAL vs. PHYSICAL mapping.

A system design in schematics and layout is generally performed using the pinout from the device datasheet, which is assigned by the default LOGICAL mapping. Hence it is necessary to cross reference the PHYSICAL vs. LOGICAL look up tables when determining the hub configuration.

Note: The MPLAB Connect tool makes configuration simple; the settings can be selected by the user with respect to the LOGICAL port numbering. The tool handles the necessary linking to the PHYSICAL port settings.

TABLE 217: USB7202 PYSICAL VS. LOGICAL PORT MAPPING

Device Pin	Pin Name (as in datasheet)	LOGICAL PORT NUMBER						PHYSICAL PORT NUMBER						
		0	1	2	3	4	5	0	1	2	3	4	5	6
5	USB2DN_DP1		X						X

8.0 BILLBOARD DEVICE

An internal Billboard device is used to communicate certain conditions within a Power Delivery system, such as a failure to establish a DisplayPort Alternate mode. For device with native Power Delivery support (USB7250, USB7251, USB7252, USB7256), the hub firmware will automatically determine the appropriate timing for attaching and detaching the Billboard device.

Devices without native Power Delivery support may still be used within a Power Delivery system, and the internal Billboard device may still be used. These hubs require control from an external Power Delivery controller. The external Power Delivery controller can force the Billboard device to attach or detach through:

- Hub SMBus Slave interface
- Hub GPIO pin

The Billboard device attaches as an added interface to the existing Hub Feature Controller interface, UART COM interface, and I²S Audio interface that are enabled.

8.1 Enabling Billboard Device Functionality

The BILLBOARD_ENABLE (bit 9) in [Runtime Flags 2 Memory](#) must be set to 1 in order for the billboard device to be enabled with the options below.

8.1.1 BILLBOARD DEVICE CONTROL THROUGH SMBUS

Issue the special command via SMBus during hub runtime stage to control the attach or detach of the Billboard device. See [Table 221](#).

TABLE 221: SPECIAL SMBUS COMMANDS

Operation	OPCODE	Description
Billboard Device Attach	AA 5C 00h	Attach the Billboard Interface
Billboard Device Detach	AA 5D 00h	Detach the Billboard Interface

8.1.2 BILLBOARD DEVICE CONTROL THROUGH GPIO

A pin which is not allocated for any other purpose in the hub configuration may be assigned the role of Billboard enable GPIO.

The pin is selected through the register below, which can be configured through OTP or through SMBus configuration.

A 'High-to-Low' transition will trigger the Billboard device to attach.

A 'Low-to-High' transition will trigger the Billboard device to detach.

See [Table 222](#).

TABLE 222: BILLBOARD DEVICE

GBYBBGPIO ADDRESS: BFD2_458Eh RESET = 14h			Billboard Device Control Input GPIO Assignment
Bit	Name	R/W	Description
7:3	Reserved	R	Reserved
2:0	GPIO_SELECT	R/W	Value selects the GPIO to be used for Billboard Device control input: Selects the PIO used for FlexConnect trigger 000b: PF6 001b: PF7 010b: PF14 011b: PF19 100b: PF26 101b: PF27 110b: PF28 111b: PF29

8.2 Billboard Device Detach Timer

The Billboard device can be configured to automatically detach after a timer expires. This timer can be configured using the register in [Table 223](#).

TABLE 223: BILLBOARD DETACH TIMER

GBYBBDetachHbUnit ADDRESS: BFD2_458Ch RESET = 00h			Billboard Device Auto Detach Timer
Bit	Name	R/W	Description
7:0	Reserved	R/W	Timer for automatic detach of the Billboard device. This is configured in 5 ms intervals. 0000_0000: Timer disabled 0000_0001: Detach after 5 ms ... 1111_1111: Detach after 1,275 ms

NOTES:

THE MICROCHIP WEBSITE

Microchip provides online support via our WWW site at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
= ISO/TS 16949 =

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
